

## Common Criteria Protection Profile

### Electronic Residence Permit Card (RP\_Card PP)

Compliant to EU-Residence Permit Specification V 1.0

BSI-CC-PP-0069

---

## **Foreword**

This Protection Profile ‘Electronic Residence Permit Card (RP\_Card PP)’ is issued by Bundesamt für Sicherheit in der Informationstechnik, Germany.

The document has been prepared as a Protection Profile (PP) following the rules and formats of Common Criteria version 3.1 [1], [2], [3], Revision 3.

Correspondence and comments to this Protection Profile should be referred to:

# 1 PP Introduction

- 1 This section provides document management and overview information required to register the protection profile and to enable a potential user of the PP to determine, whether the PP is of interest.

## 1.1 PP reference

- 2 

Title:	Protection Profile ‘Electronic Residence Permit Card (RP_Card PP)’
Sponsor:	Bundesamt für Sicherheit in der Informationstechnik
Editor(s):	Dr. Igor Furgel T-Systems GEI GmbH, SC Security Analysis & Testing
CC Version:	3.1 (Revision 3)
Assurance Level:	Minimum assurance level for this PP is EAL4 augmented.
General Status:	final
Version Number:	1.00 as of 13 <sup>th</sup> August 2010
Registration:	BSI-CC-PP-0069
Keywords:	Electronic Residence Permit Card, RP_Card, ePassport, eID, eSign, MRTD, PACE, EAC, BAC

## 1.2 TOE Overview

### 1.2.1 TOE definition and operational usage

- 3 The Target of Evaluation (TOE) addressed by the current protection profile is an electronic Residence Permit Card (RP\_Card) representing a contactless smart card programmed according to BSI TR-03110, version 2.03 [12] and being compliant to EU – Residence permit Specification [16]. This smart card provides the following applications:
  - the *ePassport*<sup>1</sup> containing the related user data<sup>2</sup> (incl. biometric) as well as data needed for authentication (incl. MRZ); this application is intended to be used by authorities, amongst other as a machine readable travel document (MRTD);
  - the *eID*<sup>3</sup> including the related user data<sup>4</sup> and data needed for authentication; this application is intended to be used for accessing official and commercial services, which require access to the user data stored in the context of this application;
  - the *eSign*<sup>5</sup> containing data needed for generating qualified electronic signatures on behalf of the RP\_Card holder as well as for authentication; this application is intended to be used in the context of official and commercial services, where a qualified electronic signature of the RP\_Card holder

---

<sup>1</sup> as specified in [12], sec. 3.1.1; see also [9], [10].

<sup>2</sup> according to [12], sec. 1.1 and 3.1.1; see also chap. 7 below for definitions

<sup>3</sup> as specified in [12], sec. 3.1.2

<sup>4</sup> according to [12], sec. 3.1.2

<sup>5</sup> as specified in [12], sec. 3.1.3

- is required. The eSign application is optional: it means that it can optionally be activated on the RP\_Card by a Certification Service Provider (or on his behalf).
- 4 For the *ePassport* application, the RP\_Card holder can control access to his user data by conscious presenting his RP\_Card to authorities<sup>6</sup>.
  - 5 For the *eID* application, the RP\_Card holder can control access to his user data by inputting his secret PIN (eID-PIN) or by conscious presenting his RP\_Card to authorities<sup>7</sup>.
  - 6 For the *eSign* application, the RP\_Card holder can control access to the electronic signature functionality by conscious presenting his RP\_Card to a service provider and inputting his secret PIN for this application: eSign-PIN<sup>8</sup>.
  - 7 *Application note 1:* In principle, it might technically be possible to grant access to the electronic signature functionality by inputting CAN only (see [12], sec. 3.3); however, this technical option shall not be allowed by the security policy defined for the eSign application (see the related conformance claim in sec. 2.2 below) due to the fact that solely the Signatory (here: the RP\_Card holder) shall be able to generate an electronic signature on his own behalf.
  - 8 *Application note 2:* Using a secret PIN by the PIN's owner represents a manifestation of his declaration of intent bound to this secret PIN. In order to reflect this fact, the eID and the eSign applications shall organisationally get different values of the respective secret PINs (eID-PIN and eSign-PIN). It is especially important, if qualified electronic signatures shall be generated by the eSign application.
  - 9 The RP\_Card is integrated into a plastic, optically readable part of the Residence Permit Card, which – as the final product – shall supersede the existing, merely optically readable Residence Permit labels. The plastic, optically readable cover of the Residence Permit Card, where the electronic Residence Permit Card is embedded in, is not part of the TOE. The tying-up of the electronic Residence Permit Card to the plastic Residence Permit Card is achieved by physical and organisational security measures being out of the scope of the current PP.
  - 10 The TOE shall comprise at least
    - i) the circuitry of the contactless chip incl. all IC dedicated software<sup>9</sup> being active in the operational phase of the TOE (the integrated circuit, IC),
    - ii) the IC Embedded Software (operating system)<sup>10</sup>,
    - iii) the ePassport, the eID and, optionally<sup>11</sup>, the eSign applications and
    - iv) the associated guidance documentation.
  - 11 *Application note 3:* Since contactless interface parts (e.g. antenna) may have impact on specific aspects of vulnerability assessment and, thus, be security relevant, these parts might be

---

<sup>6</sup> CAN or MRZ user authentication, see [12], sec. 3.3

<sup>7</sup> eID-PIN or CAN user authentication, see [12], sec. 3.3

<sup>8</sup> CAN and eSign-PIN user authentication, see [12], sec. 3.3

<sup>9</sup> usually preloaded (and often security certified) by the Chip Manufacturer

<sup>10</sup> usually – together with IC – completely implementing executable functions

<sup>11</sup> it means activated or not activated on the RP\_Card

considered as part of the TOE. The decision upon this is up to the certification body in charge by defining the evaluation methodology for the assessment of the contactless interface.

### 1.2.2 TOE major security features for operational use

12 The following TOE security features are the most significant for its operational use:

- Only authenticated terminals can get access to the user data stored on the TOE and use the security functionality of the RP\_Card under the control of the RP\_Card holder,
- Verifying authenticity and integrity as well as securing confidentiality of user data<sup>12</sup> in the communication channel between the TOE and the service provider connected<sup>13</sup>,
- Creation of electronic signatures, if the eSign application is operational,
- Averting of inconspicuous tracing of the RP\_Card,
- Self-protection of the TOE security functionality and the data stored inside.

### 1.2.3 TOE type

13 The TOE type is contactless smart card with the ePassport, the eID and the eSign applications named as a whole ‘electronic Residence Permit Card (RP\_Card)’.

14 The typical life cycle phases for the current TOE type are development<sup>14</sup>, manufacturing<sup>15</sup>, card issuing<sup>16</sup> and, finally, operational use. Operational use of the TOE is explicitly in the focus of current PP. Some single properties of the manufacturing and the card issuing life cycle phases being significant for the security of the TOE in its operational phase are also considered by the current PP. A security evaluation/certification being conform with this PP will have to involve all life cycle phases into consideration to the extent as required by the assurance package chosen here for the TOE (see chap. 2.3 ‘Package Claim’ below).

### 1.2.4 Non-TOE hardware/software/firmware

15 In order to be powered up and to communicate with the ‘external world’ the TOE needs a terminal (card reader) supporting the contactless communication according to [22].

16 From the logical point of view, the TOE shall be able to distinguish between the following terminal types, which, hence, shall be available (see [12], sec. 3.2):

---

<sup>12</sup> please note that user data might also be imported from outside of the TOE, e.g. data to be signed or a representation thereof by the eSign application

<sup>13</sup> a service provider can technically be represented by a local RF-terminal as the end point of secure communication in the sense of this PP (local authentication) or by a remote terminal as the end point of secure communication in the sense of this PP (online authentication)

<sup>14</sup> IC itself and IC embedded software

<sup>15</sup> IC manufacturing and smart card manufacturing including installation of a native card operating system

<sup>16</sup> including installation of the smart card applications and their electronic personalisation (i.e. tying the application data up to the RP\_Card holder)

- *Inspection System*<sup>17</sup>: an official terminal that is always operated by a governmental organisation (i.e. an Official Domestic or Foreign Document Verifier),
  - *Authentication terminal*: a terminal that may be operated by a governmental organisation (Official Domestic Document Verifier) or by any other organisation (Non-Official / Foreign Document Verifier), and
  - *Signature terminal*: a terminal used by RP\_Card holder for the generation of electronic signatures.
- 17 The TOE shall require the terminal of each type to authenticate itself before access according to effective terminal authorisation is granted. To authenticate a terminal either as an inspection system or authentication terminal or signature terminal as stated above, the related Inspection or Authentication Procedures must be used.
- 18 *Application note 4*: The specification [12], sec. 3.2.1 in conjunction with sec. 3.1.1 knows the following types of inspection systems:
- BIS-PACE: Basic Inspection System<sup>18</sup> with PACE<sup>19</sup>,
  - BIS-BAC: Basic Inspection System with BAC<sup>20</sup>,
  - EIS-AIP-PACE: Extended Inspection System using Advanced Inspection Procedure with PACE<sup>21</sup>,
  - EIS-AIP-BAC: Extended Inspection System using Advanced Inspection Procedure with BAC<sup>22</sup>,
  - EIS-GAP: Extended Inspection System using General Authentication Procedure<sup>23</sup>,

The current PP defines security policy for the usage of EIS-GAP, BIS-PACE (due to compliance with [7], see sec. 2.2) and EIS-AIP-BAC (due to compliance with [16] and, hence, with [6], see sec. 2.2) types of inspection systems as well as of authentication and signature terminals unconditionally using General Authentication Procedure. GAP is essentially in the scope of the current PP. It is due to the fact that GAP offers the most functionality according to [12] and the most extended protection of assets in the sense of the current PP.

Using other types of inspection systems (BIS-BAC and EIS-AIP-PACE) is out of the scope of the current PP. BIS-BAC and EIS-AIP-PACE<sup>24</sup> may *functionally* be supported by an RP\_Card, but is not part of the TOE in the context of the current PP.

The current PP has to be compliant to EU – Residence permit Specification [16] by claiming a

---

<sup>17</sup> see the *Application note 4* in § 18 for further details

<sup>18</sup> a Basic Inspection Systems (BIS) always uses Standard Inspection Procedure (SIP).

<sup>19</sup> SIP with PACE means: PACE and passive authentication with SO<sub>D</sub> according to [12], sec. 4.2, 1.1, G.1 and G.2.

<sup>20</sup> SIP with BAC means: BAC and passive authentication with SO<sub>D</sub> according to [12], sec. H, 1.1, G.1 and G.2. It is commensurate with BIS in [5] and [6]; i.e. the terminal proven the possession of MRZ optically read out from the plastic part of the card.

<sup>21</sup> Advanced Inspection Procedure (AIP) with PACE means: PACE, chip authentication, passive authentication with SO<sub>D</sub> and terminal authentication according to [12], sec. 4.2, 4.3 (version 1), 1.1, 4.4 (version 1), G.1 and G.3.

<sup>22</sup> AIP with BAC means: BAC, chip authentication, passive authentication with SO<sub>D</sub> and terminal authentication according to [12], sec. H, 4.3 (version 1), 1.1, 4.4 (version 1), G.1 and G.3. It is commensurate with EIS in [5] and [6]; please note that this EIS also covers the General Inspection Systems (GIS) in the sense of [5] and [6].

<sup>23</sup> General Authentication Procedure (GAP) means: PACE, terminal authentication (version 2), passive authentication with SO<sub>C</sub> and chip authentication (version 2) according to [12], sec. 4.2, 4.3 and 4.4.

<sup>24</sup> EIS-AIP-PACE simultaneously represents a feasible/sensible option for a future dedicated PP

formal conformance to [6], cf. [16], sec. 6.3 what induces supporting EIS-AIP-BAC for the ePassport application. Since the security properties of BAC protocol<sup>25</sup> cannot withstand some attack scenarios with a high attack potential, the related threats<sup>26</sup> are considered either not to be allied with using EIS-AIP-BAC or to be confined to only selected data groups within the ePassport application<sup>27</sup> when using EIS-AIP-BAC. Therefore, organisations being responsible for the operation of inspection systems (CVCAs and DVs) shall be aware of this context.

- 19 *Application note 5:* A [12]-compliant terminal<sup>28</sup> shall always start a communication session using PACE. If successfully, it shall then try to proceed with terminal- and chip-authentications as required by GAP in [12]. The terminal will be authorised (depending on its certificate) as the EIS-GAP in the sense of [12].  
If the trial with PACE and GAP failed, the [12]-compliant terminal may try to establish a communication session using other valid options as described above.
- 20 *Application note 6:* After the General Authentication Procedure has successfully been performed, the authenticated terminal can request for a sector-specific chip-identifier (Restricted Identification, see sec. 2.1.5, 2.4, 4.5 of [12]). Restricted Identification aims providing a temporary RP\_Card identifier being specific for a terminal sector (pseudo-anonymisation) and supporting revocation features (sec. 2.4, 4.1.1.1 of [12]). The security status of RP\_Card is not affected by Restricted Identification.
- 21 *Application note 7:* Concerning terminals for the *eSign* application, the parallels with the terminals as defined in [8] are as follows: the Authentication Terminal in the context of [12] (and of the current PP) is CGA<sup>29</sup> in [8]; the Signature Terminal in the context of [12] represents a combination of SCA<sup>30</sup> and HID<sup>31</sup> in [8].
- 22 The authorisation level of an authenticated terminal shall be determined by the effective terminal authorisation calculated from the certificate chain presented by this terminal to the TOE<sup>32</sup>. All necessary certificates of the related public key infrastructure – Country Verifying Certification Authority (CVCA) Link Certificates, Document Verifiers Certificates and Terminal Certificates – shall be available in a card verifiable format as specified in [12], Appendix C.1; see also [12], sec. 2.2.3.
- 23 The following table gives an overview which types of terminals shall be supported for which single application of the TOE, see [12], sec. 3.1 – 3.4 (please note that the effective ability of a terminal depends on its terminal authorisation level finally derived from the presented certificate chain as stated above):

---

<sup>25</sup> see [12], appendix H

<sup>26</sup> see sec. 3.2 for further details

<sup>27</sup> DG3, DG4, cf. [12], sec. 1.1.

<sup>28</sup> see appendix G of [12] for further details

<sup>29</sup> Certification Generation Application

<sup>30</sup> Signature Creation Application

<sup>31</sup> Human Interface Device

<sup>32</sup> It is based on Certificate Holder Authorization Template (CHAT), see [12], C.1.5. A CHAT is calculated as an AND-operation from the certificate chain of the terminal and the RP\_Card holder's restricting input at the terminal. This final CHAT reflects the *effective authorisation level*, see [12], sec. 2.3 and is then sent to the TOE by the command 'MSE:Set AT' within the Terminal Authentication (B.3 und B.11.1 of [12]).

	Basic Inspection System using SIP with PACE (BIS-PACE, official terminal)	Extended Inspection System using AIP with BAC (EIS-AIP-BAC, official terminal)	Extended Inspection System using GAP (EIS-GAP, official terminal)	Authentication Terminal (official or commercial terminal)	Signature Terminal
ePassport	Operations: reading all data groups excepting DG3 and DG4  User interaction: CAN or MRZ for PACE	Operations: reading only DG3 and DG4 and optional DG5-DG13 <sup>33</sup>  User interaction: MRZ for BAC	Operations: reading all data groups (incl. biometrical)  User interaction: CAN or MRZ for PACE	-	-
eID	-	-	Operations: reading all data groups  User interaction: CAN for PACE	Operations: writing a subset of data groups; reading all or a subset of data groups  User interaction: eID-PIN or eID-PUK or CAN <sup>34</sup> for PACE	-
eSign	-	-	-	Operations: activating eSign application  User interaction: eID-PIN or eID-PUK or CAN <sup>34</sup> for PACE	Operations: generating qualified electronic signatures  User interaction: CAN for PACE, then eSign-PIN for access to

<sup>33</sup> cf. table 1.2 in sec. 1.1 of [12].

<sup>34</sup> if the terminal indicates such required authorisation with PACE (an official terminal), see sec. 2.3 in [12]

	Basic Inspection System using SIP with PACE (BIS-PACE, official terminal)	Extended Inspection System using AIP with BAC (EIS-AIP-BAC, official terminal)	Extended Inspection System using GAP (EIS-GAP, official terminal)	Authentication Terminal (official or commercial terminal)	Signature Terminal
				In the eSign context, the current terminal is equivalent to CGA in [8]	the signature function  In the eSign context, the current terminal is equivalent – as a general term – to SCA and HID in [8]

**Table 1: RP\_Card applications vs. terminal types**

## 2 Conformance Claims

### 2.1 CC Conformance Claim

24 This protection profile claims conformance to

- Common Criteria for Information Technology Security Evaluation, Part 1: Introduction and General Model; CCMB-2009-07-001, Version 3.1, Revision 3, July 2009 [1]
- Common Criteria for Information Technology Security Evaluation, Part 2: Security Functional Components; CCMB-2009-07-002, Version 3.1, Revision 3, July 2009 [2]
- Common Criteria for Information Technology Security Evaluation, Part 3: Security Assurance Requirements; CCMB-2009-07-003, Version 3.1, Revision 3, July 2009 [3]

as follows

- Part 2 extended,
- Part 3 conformant.

25 The

- Common Methodology for Information Technology Security Evaluation, Evaluation Methodology; CCMB-2009-07-004, Version 3.1, Revision 3, July 2009, [4]

has to be taken into account.

### 2.2 PP Claim

26 This PP claims *strict* conformance to ‘Common Criteria Protection Profile Machine Readable Travel Document with „ICAO Application“, Extended Access Control, BSI-CC-PP-0056-2009, version 1.10, 25th March 2009’ [6].

27 *Application note 8:* The conformance claim above covers the part of the security policy for the *ePassport* application of the TOE corresponding to the security policy defined in [6]. This conformance claim is a requirement of [16], sec. 6.3 and, in such a way, enforces including the EIS-AIP-BAC type of inspection system in the current PP.

Since [6] (see sec. 2.2 and P.BAC-PP there) requires the TOE to fulfill the ‘Common Criteria Protection Profile Machine Readable Travel Document with „ICAO Application“, Basic Access Control, BSI-CC-PP-0055-2009, version 1.10, 25th March 2009’ [5] as a premise to the protection profile [6], the conformance claim above ‘conveys’ this requirement into the current PP, i.e. the TOE has also to successfully be evaluated and certified in accordance with [5].

28 This PP claims *strict* conformance to ‘Common Criteria Protection Profile Electronic Passport using Standard Inspection Procedure with PACE, BSI-CC-PP-0068-2010, version 0.92, 30th April 2010’ [7].

29 *Application note 9:* The conformance claim above covers the part of the security policy for the *ePassport* application of the TOE corresponding to the security policy defined in [7]. This conformance claim enforces including the BIS-PACE type of inspection system in the current PP.

30 This PP claims *strict* conformance to ‘Protection Profiles for Secure Signature Creation Device – Part 2: Device with key generation, EN 14169-1:2009, ver. 1.03, 2009-12, BSI-CC-PP-0059-2009’ [8].

- 31 *Application note 10:* The last conformance claim covers the part of the security policy for the *eSign* application of the TOE corresponding to the security policy defined in [8] and, hence, is applicable, if the *eSign* application is operational. In addition to [8], the current PP specifies authentication and communication protocols (GAP) having to be used for the *eSign* application of the TOE. These protocols contribute to securing SVD-export, DTBS-import and VAD-import functionality.
- 32 *Application note 11:* The *eSign* application of the TOE is intended to generate qualified electronic signatures. The main specific property distinguishing qualified electronic signatures from advanced is that they base on qualified certificates<sup>35</sup> and are created by secure signature creation devices (SSCD).  
Since the current TOE (its part the *eSign* application) shall be used as SSCD due to the PP conformance claim above, the only specific difference remained is using qualified certificates for qualified signatures. Whether a certificate is qualified or not is a pure organisational issue from the point of view of the TOE which does not impact the TOE functionality. Therefore, the PP conformance claim above covers not only qualified signatures, but can also do this for advanced signatures under an appropriate interpretation of the organisational security policies P.CSP\_QCert and P.QSign in [8].

## 2.3 Package Claim

- 33 The current PP is conformant to the following security requirements package:
- Assurance package EAL4 augmented with ALC\_DVS.2, ATE\_DPT.2 and AVA\_VAN.5 as defined in the CC, part 3 [3].

## 2.4 Conformance Claim Rationale

- 34 *Application note 12:* The current PP claims *strict* conformance to the following protection profiles as required there: ICAO-EAC PP (sec. 2.5 in [6]), PACE-Pass PP (sec. 2.5 in [7]) and SSCD Core PP (sec. 6.4 in [8]). Due to this fact, it is sensible to distinguish between separated sets of {TOE type, SPD statement, security objectives statement, security requirements statement} for each application residing in the TOE: ePassport, eID and eSign, respectively<sup>36</sup>, unless the items are identical or hierarchical as in the case of the SARs.  
The author of the current PP will mark item's belonging to each TOE's application off.

### 2.4.1 'Protection Profile Machine Readable Travel Document with „ICAO Application", Extended Access Control'

#### TOE Type

- 35 The PP [6] does not explicitly state any TOE type, but it can be inferred from the TOE definition in sec. 1.2 there: '... (TOE) is the contactless integrated circuit chip of machine readable travel documents (MRTD's chip) programmed according to the Logical Data Structure (LDS) ... and providing the Basic Access Control and Extended Access Control according to the 'ICAO Doc 9303' ... and BSI TR-03110...'.  

---

<sup>35</sup> being valid at signature creation time

<sup>36</sup> see Application notes in sec. 2.2

- 36 This TOE type is obviously commensurate with the current TOE type in the part being provided by the ePassport application, see sec. 1.2.1 and 1.2.3 above.

### SPD Statement

- 37 The security problem definition (SPD) of the current PP contains the security problem definition of the PP [6]. The current SPD includes the same threats, organisational security policies and assumptions as for the TOE in [6] and comprehends several additional items as stated in chap. 3 below.
- 38 *Application note 13:* Strict conformance presumes that assumptions of the current PP shall be identical to the assumptions of each PP to which the conformance is being claimed. As explained in the *Application note 12* above, the assumptions for the current PP might consist of three blocks: assumptions for the ePassport, for the eID and assumptions for the eSign application. In this context and due to the current state of the art of writing PPs/STs, all assumptions from [6] are completely covered by the OSP block for the ePassport application and by the assurance package chosen within the current PP; see sec. 3.4 for further details.

### Security Objectives Statement

- 39 The security objectives statement for the TOE in the current PP includes all the security objectives for the TOE of the PP [6] and comprehends several additional items as stated in chap. 4.1 below.
- 40 The security objectives statement for the TOE's operational environment in the current PP includes all security objectives for the operational environment of the PP [6] and comprehends several additional items as stated in chap. 4.2 below.
- 41 *Application note 14:* Strict conformance presumes that the security objectives for the operational environment of the current PP shall be identical to those items of each PP to which the conformance is being claimed (unless a re-assignment according to [1], sec. 9.3). As explained in the *Application note 12* above, the security objectives for the operational environment for the current PP might consist of three blocks: objectives for the ePassport, for the eID and objectives for the eSign application. In this context, the current block of environmental objectives for the ePassport application completely covers the respective objectives from [6].

### Security Requirements Statement

- 42 The PP [6] conforms to CC v3.1, revision 2, the current PP – to CC v3.1, revision 3. In respect to this, it is to rely on the statement of CCMB that respective assurance levels achieved by applying different CC revisions are equivalent to each other.
- 43 The SFR statement for the TOE in the current PP includes all the SFRs for the TOE of the PP [6] and comprehends several additional items as stated in chap. 6.1 below.
- 44 The SAR statement for the TOE in the current PP includes all the SARs for the TOE of the PP [6] as stated in chap. 6.2 below.
- 45 *Application note 15:* Strict conformance allows that the security requirements for the TOE of the current PP may be hierarchically stronger than those items of each PP to which the conformance is being claimed.

## 2.4.2 ‘Protection Profile Electronic Passport using Standard Inspection Procedure with PACE’

### TOE Type

- 46 The TOE type stated in [7], sec. 1.2.3 is ‘...contactless smart card with the *ePassport* application named as a whole ‘electronic Passport (ePass)’’.
- 47 This TOE type is obviously commensurate with the current TOE type in the part being provided by the ePassport application, see sec. 1.2.1 and 1.2.3 above.

### SPD Statement

- 48 The security problem definition (SPD) of the current PP contains the security problem definition of the PP [7]. The current SPD includes the same threats, organisational security policies and assumptions as for the TOE in [7] and comprehends several additional items as stated in chap. 3 below.
- 49 *Application note 16:* Strict conformance presumes that assumptions of the current PP shall be identical to the assumptions of each PP to which the conformance is being claimed. As explained in the *Application note 12* above, the assumptions for the current PP might consist of three blocks: assumptions for the ePassport, for the eID and assumptions for the eSign application. In this context, the current assumptions block for the ePassport application is identical to the assumptions from [7] (there is no assumption for the ePassport application).

### Security Objectives Statement

- 50 The security objectives statement for the TOE in the current PP includes all the security objectives for the TOE of the PP [7] and comprehends several additional items as stated in chap. 4.1 below.
- 51 The security objectives statement for the TOE’s operational environment in the current PP includes all security objectives for the operational environment of the PP [7] and comprehends several additional items as stated in chap. 4.2 below.
- 52 *Application note 17:* Strict conformance presumes that the security objectives for the operational environment of the current PP shall be identical to those items of each PP to which the conformance is being claimed (unless a re-assignment according to [1], sec. 9.3). As explained in the *Application note 12* above, the security objectives for the operational environment for the current PP might consist of three blocks: objectives for the ePassport, for the eID and objectives for the eSign application. In this context, the current block of environmental objectives for the ePassport application is identical to the equivalent objectives from [7].

### Security Requirements Statement

- 53 The SFR statement for the TOE in the current PP includes all the SFRs for the TOE of the PP [7] and comprehends several additional items as stated in chap. 6.1 below.
- 54 The SAR statement for the TOE in the current PP includes all the SARs for the TOE of the PP [7] as stated in chap. 6.2 below.

- 55 *Application note 18:* Strict conformance allows that the security requirements for the TOE of the current PP may be hierarchically stronger than those items of each PP to which the conformance is being claimed.

### 2.4.3 ‘Protection Profiles for Secure Signature Creation Device – Part 2: Device with key generation’

#### TOE Type

- 56 The TOE type stated in [8], sec. 5.4.2 is ‘... a combination of hardware and software configured to securely create, use and manage signature-creation data (SCD). The SSCD protects the SCD during its whole life cycle as to be used in a signature-creation process solely by its signatory’.
- 57 This TOE type is obviously commensurate with the current TOE type in the part being provided by the eSign application, see sec. 1.2.1 and 1.2.3 above.

#### SPD Statement

- 58 The security problem definition (SPD) of the current PP contains the security problem definition of the PP [8]. The current SPD includes the same threats, organisational security policies and assumptions as for the TOE in [8] and comprehends several additional items as stated in chap. 3 below.
- 59 *Application note 19:* Strict conformance presumes that assumptions of the current PP shall be identical to the assumptions of each PP to which the conformance is being claimed. As explained in the *Application note 12* above, the assumptions for the current PP might consist of three blocks: assumptions for the ePassport, for the eID and assumptions for the eSign application. In this context, the current assumptions block for the eSign application is identical to the assumptions from [8].

#### Security Objectives Statement

- 60 The security objectives statement for the TOE in the current PP includes all the security objectives for the TOE of the PP [8] and comprehends several additional items as stated in chap. 4.1 below.
- 61 The security objectives statement for the TOE’s operational environment in the current PP includes all security objectives for the operational environment of the PP [8] and comprehends several additional items as stated in chap. 4.2 below.
- 62 *Application note 20:* Strict conformance presumes that the security objectives for the operational environment of the current PP shall be identical to those items of each PP to which the conformance is being claimed (unless a re-assignment according to [1], sec. 9.3). As explained in the *Application note 12* above, the security objectives for the operational environment for the current PP might consist of three blocks: objectives for the ePassport, for the eID and objectives for the eSign application. In this context, the current block of environmental objectives for the eSign application is identical to the equivalent objectives from [8].

## Security Requirements Statement

- 63 The SFR statement for the TOE in the current PP includes all the SFRs for the TOE of the PP [8] and comprehends several additional items as stated in chap. 6.1 below.
- 64 The SAR statement for the TOE in the current PP includes all the SARs for the TOE of the PP [8] as stated in chap. 6.2 below. The current assurance package contains the assurance components ALC\_DVS.2 and ATE\_DPT.2 being hierarchical to ALC\_DVS.1 respectively ATE\_DPT.1 as required by [8].
- 65 *Application note 21:* Strict conformance allows that the security requirements for the TOE of the current PP may be hierarchically stronger than those items of each PP to which the conformance is being claimed.

## 2.5 Conformance statement

- 66 This PP requires *strict* conformance of any ST or PP claiming conformance to this PP.

### 3 Security Problem Definition

- 67 *Application note 22:* Since the current PP covers three different applications – ePassport, eID and eSign –, the author decided to trace the belonging of each formal item within the set of {SPD statement, security objectives statement, security requirements statement} to the respective application; cf. also the *Application note 12* in sec. 2.4 above.

#### 3.1 Introduction

##### Assets

- 68 The primary assets to be protected by the TOE as long as they are in scope of the TOE are (please refer to the glossary in chap. 7 for the term definitions)

Object No.	Asset	Definition	Generic security property to be maintained by the current security policy
ePassport, eID, eSign			
1	user data stored on the TOE	All data (being not authentication data) stored in the context of the applications of the RP_Card as defined in [12] and (i) being allowed to be <i>read out</i>	Confidentiality <sup>39</sup> Integrity Authenticity

---

<sup>37</sup> Since the Restricted Identification according to [12], sec. 4.5 represents just a functionality of the RP\_Card, the key material needed for this functionality and stored in the TOE is treated here as User Data in the sense of the CC.

<sup>38</sup> corresponds to SCD in [8]

Object No.	Asset	Definition	Generic security property to be maintained by the current security policy
		<p>or <i>written</i> solely by an authenticated terminal (in the sense of [12], sec. 3.2) respectively</p> <p>(ii) being allowed to be <i>used</i> solely by an authenticated terminal (in the sense of [12], sec. 3.2) (the private Restricted Identification key<sup>37</sup>) respectively</p> <p>(iii) being allowed to be <i>used</i> solely by the authenticated RP_Card holder (the private signature key within the eSign application<sup>38</sup>).</p> <p>This asset covers ‘User Data on the MRTD’s chip’ and ‘Logical MRTD sensitive User Data’ in [6], ‘user data stored on the TOE’ (object #1) in [7] as well as ‘SCD’ and ‘DTBS/R’ in [8].</p>	
2	user data transferred between the TOE and the service provider connected <sup>40</sup>	<p>All data (being not authentication data) being transferred in the context of the applications of the RP_Card as defined in [12] between the TOE and an authenticated terminal (in the sense of [12], sec. 3.2).</p> <p>User data can be received and sent (exchange <math>\Leftrightarrow</math> {receive, send}).</p> <p>This asset covers ‘user data transferred between the TOE and the service provider connected (i.e. an authority represented by Basic Inspection System with PACE)’ (object #2) in [7] and ‘DTBS’ in [8].</p>	Confidentiality <sup>41</sup> Integrity Authenticity
3	RP_Card tracing	Technical information about the	unavailability <sup>42</sup>

<sup>39</sup> Though not each data element stored on the TOE represents a secret, the specification [12] anyway requires securing their confidentiality: only terminals authenticated either using GAP or as EIS-AIP-BAC or as BIS-PACE according to [12] can get access to the user data stored.

<sup>40</sup> for the ePassport application, the service provider is always an authority represented by a local RF-terminal

<sup>41</sup> Though not each data element being transferred represents a secret, the specification [12] anyway requires securing their confidentiality: the secure messaging in encrypt-then-authenticate mode is required for all messages according to [12], sec. 4.2.2, 4.3.2, 4.4.2.

<sup>42</sup> represents a prerequisite for anonymity of the RP\_Card holder

Object No.	Asset	Definition	Generic security property to be maintained by the current security policy
	data	current and previous locations of the RP_Card gathered by inconspicuous (for the RP_Card holder) recognising the TOE knowing <i>neither</i> CAN <i>nor</i> MRZ <i>nor</i> eID-PIN <i>nor</i> eID-PUK.  TOE tracing data can be provided / gathered.  This asset covers 'ePass tracing data' (object #3) in [7].	

**Table 2: Primary assets**

- 69 *Application Note 23:* Please note that user data being referred to in the table above include, amongst other, individual-related (personal) data of the RP\_Card holder which also include his sensitive (biometrical) data. Hence, the general security policy defined by the current PP also secures these specific RP\_Card holder's data as stated in the table above.
- 70 All these primary assets represent User Data in the sense of the CC.
- 71 The secondary assets also having to be protected by the TOE in order to achieve a sufficient protection of the primary assets are:

Object No.	Asset	Definition	Property to be maintained by the current security policy
ePassport, eID, eSign			
4	Accessibility to the TOE functions and data only for authorised subjects	Property of the TOE to restrict access to TSF and TSF-data stored in the TOE to authorised subjects only.  This asset covers the equivalent object #4 in [7].	Availability
5	Genuineness of the TOE	Property of the TOE to be authentic in order to provide claimed security functionality in a proper way.  This asset covers the equivalent object #5 in [7] and 'Authenticity of the MRTD's chip' in [6].	Availability
6	TOE immanent secret cryptographic keys	Permanently or temporarily stored secret cryptographic material used by the TOE in order to enforce its security functionality <sup>43</sup> .  This asset covers the equivalent object #6 in [7].	Confidentiality Integrity

<sup>43</sup> please note that the private signature key within the eSign application (SCD) belongs to the object No. 1 'user data stored' above.

Object No.	Asset	Definition	Property to be maintained by the current security policy
7	TOE immanent non-secret cryptographic material	Permanently or temporarily stored non-secret cryptographic (public) keys and other non-secret material (Card/Chip and Document Security Objects SO <sub>C</sub> and SO <sub>D</sub> , respectively, containing digital signatures) used by the TOE in order to enforce its security functionality. This asset covers the respective object #7 in [7] and 'SVD' in [8].	Integrity Authenticity
8	Secret RP_Card holder authentication data	Secret authentication information for the RP_Card holder being used for verification of the authentication attempts as authorised RP_Card holder (– eID-PIN and eID-PUK <sup>44</sup> stored in the RP_Card as well as – eSign-PIN (and eSign-PUK, if any) <sup>45</sup> (i) stored in the RP_Card <sup>46</sup> and (ii) transferred to it <sup>47</sup> )	Confidentiality Integrity
9	RP_Card communication establishment authorisation data	Restricted-revealable <sup>48</sup> authorisation information for a human user being used for verification of the authorisation attempts as authorised user (CAN for ePassport, eID, eSign; MRZ for ePassport). These data are stored in the TOE and are not to convey to it. This asset covers the respective object #8 in [7].	Confidentiality <sup>48</sup> Integrity

**Table 3: Secondary assets**

72 *Application Note 24:* RP\_Card holder authentication and RP\_Card communication establishment authorisation data are represented by two different entities: (i) reference information being persistently stored in the TOE and (ii) verification information being provided as input for the TOE by a human user as an authentication/authorisation attempt.

The TOE shall secure the reference information as well as – together with the terminal connected<sup>49</sup> – the verification information in the 'TOE <-> terminal' channel, if it has to be transferred to the TOE. Please note that CAN, MRZ, eID-PIN and eID-PUK are not to convey to the TOE.

<sup>44</sup> eID-PIN and eID-PUK are global secrets being valid for the entire RP\_Card.

<sup>45</sup> eSign-PIN (and eSign-PUK, if any) are local secrets being valid only within the eSign application.

<sup>46</sup> is commensurate with RAD in [8]

<sup>47</sup> is commensurate with VAD in [8]

<sup>48</sup> The RP\_Card holder may reveal, if necessary, his or her verification values of CAN and MRZ to an authorised person or device who definitely act according to respective regulations and are trustworthy.

<sup>49</sup> the input device of the terminal

73 The secondary assets represent TSF and TSF-data in the sense of the CC.

### Subjects and external entities

74 This protection profile considers the following subjects:

External Entity No.	Subject No.	Role	Definition
1	1	RP_Card holder	A person for whom the RP_Card Issuer has personalised the RP_Card <sup>50</sup> . This entity is commensurate with 'MRTD Holder' in [6], 'ePass holder' (subject #1) in [7] and 'Signatory' in [8]. Please note that an RP_Card holder can also be an attacker (s. below).
2	-	RP_Card presenter	A person presenting the RP_Card to a terminal <sup>51</sup> and claiming the identity of the RP_Card holder. This external entity is commensurate with 'Traveller' in [6], 'ePass presenter' (external entity #2) in [7] and 'User' in [8]. Please note that an RP_Card presenter can also be an attacker (s. below).
3	-	Service Provider (SP)	An official or commercial organisation providing services which can be used by the RP_Card holder. Service Provider uses rightful terminals managed by a DV. This external entity is commensurate with the respective external entity #3 in [7].
4	2	Terminal	A terminal is any technical system communicating with the TOE through the contactless interface. The role 'Terminal' is the default role for any terminal being recognised by the TOE as neither PCT nor BIS-PACE nor EIS-AIP-BAC nor EIS-GAP nor ATT nor SGT ('Terminal' is used by the RP_Card presenter). This entity is commensurate with 'Terminal' in [6] and the respective external entity #4 in [7].
5	3	PACE Terminal (PCT)	A technical system verifying correspondence between the password stored in the RP_Card and the related value presented to the terminal by the RP_Card presenter. PCT implements the terminal's part of the PACE protocol and authenticates itself to the RP_Card using a shared password (CAN, eID-PIN, eID-PUK

<sup>50</sup> i.e. this person is uniquely associated with a concrete electronic Residence Permit Card

<sup>51</sup> in the sense of [12]

External Entity No.	Subject No.	Role	Definition
			<p>or MRZ).</p> <p>This entity is commensurate with the respective external entity #5 in [7].</p> <p>See also <i>Application note 4</i> and par. 23 above and [12], chap. 3.3, 4.2, table 1.2 and G.2</p>
6	4	Basic Inspection System with PACE (BIS-PACE)	<p>A technical system being used by an inspecting authority<sup>52</sup> and operated by a governmental organisation (i.e. an Official Domestic or Foreign Document Verifier) and verifying the RP_Card presenter as the RP_Card holder (for <i>ePassport</i>: by comparing the real biometrical data (face) of the ePass presenter with the stored biometrical data (DG2) of the RP_Card holder).</p> <p>BIS-PACE is a PCT additionally supporting/applying the Passive Authentication protocol and is authorised<sup>53</sup> by the RP_Card Issuer through the Document Verifier of receiving state to read a subset of data stored in the ePassport application on the RP_Card.</p> <p>BIS-PACE in the context of [12] (and of the current PP) is similar, but not equivalent to the Basic Inspection System (BIS) as defined in [5].</p> <p>This entity is commensurate with the respective external entity #6 in [7].</p> <p>See also <i>Application note 4</i> and par. 23 above and [12], chap. 3.2.1, G.1 and G.2.</p>
7	5	Extended Inspection System using AIP with BAC (EIS-AIP-BAC)	<p>A technical system being used by an inspecting authority<sup>54</sup> and operated by a governmental organisation (i.e. an Official Domestic or Foreign Document Verifier) and verifying the RP_Card presenter as the RP_Card holder (for <i>ePassport</i>: by comparing the real biometrical data (face, fingerprint or iris) of the RP_Card presenter with the stored biometrical data (DG2 – DG4) of the RP_Card holder).</p> <p>EIS-AIP-BAC is a Basic Inspection System (BIS) in the sense of [5] additionally supporting/applying Chip Authentication (incl. passive authentication) and Terminal Authentication protocols in the context of AIP and is authorised<sup>55</sup> by the RP_Card Issuer through the Document Verifier of receiving</p>

<sup>52</sup> concretely, by a control officer

<sup>53</sup> by organisational measures

<sup>54</sup> concretely, by a control officer

<sup>55</sup> by issuing terminal certificates

External Entity No.	Subject No.	Role	Definition
			state to read a subset of data stored on the RP_Card. EIS-AIP-BAC in the context of [12] (and of the current PP) is equivalent to the Extended Inspection System (EIS) as defined in [6]. See also <i>Application note 4</i> and par. 23 above and [12], chap. 3.2 and C.4.
8	6	Extended Inspection System using GAP (EIS-GAP)	A technical system being used by an inspecting authority <sup>56</sup> and operated by a governmental organisation (i.e. an Official Domestic or Foreign Document Verifier) and verifying the RP_Card presenter as the RP_Card holder (for <i>ePassport</i> : by comparing the real biometrical data (face, fingerprint or iris) of the RP_Card presenter with the stored biometrical data (DG2 – DG4) of the RP_Card holder). EIS-GAP is a PCT additionally supporting/applying Chip Authentication (incl. passive authentication) and Terminal Authentication protocols in the context of GAP and is authorised <sup>57</sup> by the RP_Card Issuer through the Document Verifier of receiving state to read a subset of data stored on the RP_Card. EIS-GAP in the context of [12] (and of the current PP) is similar, but not equivalent to the Extended Inspection System (EIS) as defined in [6]. See also <i>Application note 4</i> and par. 23 above and [12], chap. 3.2 and C.4.
9	7	Authentication Terminal (ATT)	A technical system being operated and used either by a governmental organisation (Official Domestic Document Verifier) or by any other, also commercial organisation and (i) verifying the RP_Card presenter as the RP_Card holder (using secret eID-PIN <sup>58</sup> ), (ii) updating a subset of the data of the eID application and (iii) activating the eSign application. An Authentication Terminal is a PCT additionally supporting the Chip Authentication (incl. passive authentication) and the Terminal Authentication protocols in the context of GAP and is authorised by the RP_Card Issuer through the Document Verifier of receiving branch (by issuing terminal certificates) to access a subset of the data stored on

<sup>56</sup> concretely, by a control officer

<sup>57</sup> by issuing terminal certificates

<sup>58</sup> secret eID-PUK can be used for unblocking the eID-PIN as well as the eSign-PIN and resetting the related retry counters.

External Entity No.	Subject No.	Role	Definition
			the RP_Card. See also par. 23 above and [12], chap. 3.2 and C.4.
10	8	Signature Terminal (SGT)	A technical system used for generation of electronic signatures. A Signature Terminal is a PCT additionally supporting the Chip Authentication (incl. passive authentication) and the Terminal Authentication protocols in the context of GAP and is authorised by the RP_Card Issuer through the Document Verifier of receiving branch (by issuing terminal certificates) to access a subset of the data stored on the RP_Card. See also par. 23 above and [12], chap. 3.2 and C.4.
11	9	Document Verifier (DV)	An organisation enforcing the policies of the CVCA and of a Service Provider (governmental or commercial organisation) and managing terminals belonging together (e.g. terminals operated by a State's border police), by – inter alia – issuing Terminal Certificates. A Document Verifier is therefore a CertA, authorised by at least the national CVCA to issue certificates for national terminals, see [12], chap. 2.2.2. There can be Domestic and Foreign DV: A domestic DV is acting under the policy of the domestic CVCA being run by the RP_Card Issuer; a foreign DV is acting under a policy of the respective foreign CVCA (in this case there shall be an appropriate agreement <sup>59</sup> between the RP_Card Issuer und a foreign CVCA ensuring enforcing the RP_Card Issuer's privacy policy <sup>60</sup> ). This entity is commensurate with 'Document Verifier' in [6] and with the respective external entity #7 in [7].
12	10	Country Verifying Certification Authority (CVCA)	An organisation enforcing the privacy policy of the RP_Card Issuer with respect to protection of user data stored in the RP_Card (at a trial of a terminal to get an access to these data). The CVCA represents the country specific root of the PKI for the rightful terminals (EIS-AIP-BAC, EIS-GAP, ATT, SGT) and creates the Document Verifier Certificates within this PKI. Updates of the public key of the CVCA are distributed in form of CVCA

<sup>59</sup> the form of such an agreement may be of formal and informal nature; the term 'agreement' is used in the current PP in order to reflect an appropriate relationship between the parties involved.

<sup>60</sup> Existing of such an agreement may technically be reflected by means of issuing a C<sub>CVCA-F</sub> for the Public Key of the foreign CVCA signed by the domestic CVCA.

External Entity No.	Subject No.	Role	Definition
			<p>Link-Certificates, see [12], chap. 2.2.1.</p> <p>The Country Signing Certification Authority (CSCA) issuing certificates for Document Signers (cf. [9]) and the domestic CVCA may be integrated into a single entity, e.g. a Country CertA. However, even in this case, separate key pairs must be used for different roles, see [12], sec. 2.2.1.</p> <p>This entity is commensurate with ‘Country Verifying Certification Authority’ in [6] and with the respective external entity #8 in [7].</p>
13	-	Document Signer (DS)	<p>An organisation enforcing the policy of the CSCA and signing the Card/Chip and Document Security Objects stored on the RP_Card for passive authentication.</p> <p>A Document Signer is authorised by the national CSCA issuing the Document Signer Certificate (C<sub>DS</sub>), see [12], chap. 1.1 and [9].</p> <p>This role is usually delegated to a Personalisation Agent.</p> <p>This entity is commensurate with the respective external entity #9 in [7].</p>
14	-	Country Signing Certification Authority (CSCA)	<p>An organisation enforcing the policy of the RP_Card Issuer with respect to confirming correctness of user and TSF data stored in the RP_Card. The CSCA represents the country specific root of the PKI for the RP_Cards and creates the Document Signer Certificates within this PKI.</p> <p>The CSCA also issues the self-signed CSCA Certificate (C<sub>CSCA</sub>) having to be distributed by strictly secure diplomatic means, see. [9], 5.1.1.</p> <p>The Country Signing Certification Authority issuing certificates for Document Signers (cf. [9]) and the domestic CVCA may be integrated into a single entity, e.g. a Country CertA. However, even in this case, separate key pairs must be used for different roles, see [12], sec. 2.2.1.</p> <p>This entity is commensurate with the respective external entity #10 in [7].</p>
15	-	Certification Service Provider (CSP)	<p>An organisation issuing certificates and providing other services related to electronic signatures. There can be ‘common’ and ‘qualified’ CSP: A ‘qualified’ Certification Service Provider can also issue qualified certificates<sup>61</sup>.</p>

<sup>61</sup> cf. *Application note 11* in sec. 2.2 above.

External Entity No.	Subject No.	Role	Definition
			A CSP is the Certification Service Provider in the sense of [8].
16	11	Personalisation Agent	<p>An organisation acting on behalf of the RP_Card Issuer to personalise the RP_Card for the RP_Card holder by some or all of the following activities: (i) establishing the identity of the RP_Card holder for the biographic data in the RP_Card<sup>62</sup>, (ii) enrolling the biometric reference data of the RP_Card holder<sup>63</sup>, (iii) writing a subset of these data on the physical Residence Permit Card (optical personalisation) and storing them in the RP_Card (electronic personalisation) for the RP_Card holder as defined in [12], (iv) writing the document details data, (v) writing the initial TSF data, (vi) signing the Card/Chip Security Object and the Document Security Object (ePassport) defined in [9] (in the role of DS).</p> <p>Please note that the role 'Personalisation Agent' may be distributed among several institutions according to the operational policy of the RP_Card Issuer. Generating signature key pair(s) is not in the scope of the tasks of this role.</p> <p>This entity is commensurate with 'Personalisation agent' in [6], the respective external entity #11 in [7] and 'Administrator' in [8].</p>
17	12	Manufacturer	<p>Generic term for the IC Manufacturer producing integrated circuit and the RP_Card Manufacturer completing the IC to the RP_Card. The Manufacturer is the default user of the TOE during the manufacturing life cycle phase<sup>64</sup>. The TOE itself does not distinguish between the IC Manufacturer and RP_Card Manufacturer using this role Manufacturer.</p> <p>This entity is commensurate with 'Manufacturer' in [6] and the respective external entity #12 in [7].</p>
18	-	Attacker	<p>A threat agent (a person or a process acting on his behalf) trying to undermine the security policy defined by the current PP, especially to change properties of the assets having to be maintained. The attacker is assumed to possess an at most <i>high</i> attack potential.</p> <p>Please note that the attacker might 'capture' any</p>

<sup>62</sup> relevant for the ePassport, the eID and the eSign applications

<sup>63</sup> relevant for the ePassport application

<sup>64</sup> cf. also par. 14 in sec. 1.2.3 above

External Entity No.	Subject No.	Role	Definition
			subject role recognised by the TOE. This entity is commensurate with ‘Attacker’ in [6], the respective external entity #13 in [7] and ‘Attacker’ in [8].

**Table 4: Subjects and external entities<sup>65</sup>**

## 3.2 Threats

75 This section describes the threats to be averted by the TOE independently or in collaboration with its IT environment. These threats result from the assets protected by the TOE and the method of TOE’s use in the operational environment.

76 The following threats are defined in the current PP (they are initially derived from the ICAO-BAC PP [5] and ICAO-EAC PP [6], then from the ID\_Card PP BSI-CC-PP-0061-2009):

### 77 **T.Skimming** **Skimming RP\_Card / Capturing Card-Terminal Communication**

An attacker imitates an inspection system, an authentication or a signature terminal in order to get access to the *user data stored on or transferred between the TOE and the service provider connected* via the contactless interface of the TOE. The attacker cannot read and does not know the correct value of the shared password (CAN, MRZ, eID-PIN, eID-PUK) in advance. This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 25:* A product using BIS-BAC cannot avert this threat in the context of the security policy defined in this PP. When using EIS-AIP-BAC, this threat is confined to only selected data groups (DG3, DG4) within the ePassport application, see also the *Application note 4* above.

*Application Note 26:* MRZ is printed and CAN is printed or stuck on the Residence Permit Card. Please note that neither CAN nor MRZ effectively represent secrets, but are restricted-revealable, cf. OE.Card-Holder.

### 78 **T.Eavesdropping** **Eavesdropping on the communication between the TOE and a rightful terminal**

An attacker is listening to the communication between the RP\_Card and a rightful terminal in order to gain the *user data transferred between the TOE and the service provider connected*. This item concerns the following application(s): ePassport, eID, eSign.

<sup>65</sup> This table defines external entities and subjects in the sense of [1]. Subjects can be recognised by the TOE independent of their nature (human or technical user). As result of an appropriate identification and authentication process, the TOE creates – for each of the respective external entity – an ‘image’ inside and ‘works’ then with this TOE internal image (also called subject in [1]). From this point of view, the TOE itself does not differ between ‘subjects’ and ‘external entities’. There is no dedicated subject with the role ‘attacker’ within the current security policy, whereby an attacker might ‘capture’ any subject role recognised by the TOE.

*Application Note 27:* A product using BIS-BAC cannot avert this threat in the context of the security policy defined in this PP. When using EIS-AIP-BAC, this threat is confined to only selected data groups (DG3, DG4) within the ePassport application, see also the *Application note 4* above.

#### 79 **T.Tracing** **Tracing RP\_Card**

An attacker tries to gather *TOE tracing data* (i.e. to trace the movement of the RP\_Card) unambiguously identifying it remotely by establishing or listening to a communication via the contactless interface of the TOE. The attacker cannot read and does not know the correct values of shared passwords (CAN, MRZ, eID-PIN, eID-PUK) in advance.

This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 28:* A product using BAC (whatever the type of the inspection system is: BIS-BAC or EIS-AIP-BAC) cannot avert this threat in the context of the security policy defined in this PP. Hence, this threat is considered not to be allied with using EIS-AIP-BAC, see also the *Application note 4* above.

#### 80 **T.Counterfeit** **Counterfeiting RP\_Card**

An attacker produces an unauthorised copy or reproduction of a *genuine RP\_Card* to be used as part of a counterfeit Residence Permit Card: he or she may generate a new data set or extract completely or partially the data from a genuine RP\_Card and copy them on another functionally appropriate chip to imitate this genuine RP\_Card. This violates the authenticity of the RP\_Card being used either for authentication of an RP\_Card presenter as the RP\_Card holder or for authentication of the RP\_Card as a genuine secure signature creation device.

This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 29:* Since the Standard Inspection Procedure does not support any unique-secret-based authentication of the chip (no Chip Authentication), a product using Basic Inspection System (whatever the used protocol is: BAC or PACE) cannot avert this threat in the context of the security policy defined in this PP. Hence, this threat is considered not to be allied with using BIS-PACE, see also the *Application note 4* above.

#### 81 **T.Forgery** **Forgery of Data**

An attacker fraudulently alters the *User Data* or/and *TSF-data stored on the RP\_Card* or/and *exchanged between the TOE and the service provider connected* in order to outsmart either the authenticated terminal (BIS-PACE, EIS-AIP-BAC, EIS-GAP, ATT or SGT) by the means of changed RP\_Card holder's related reference data (like biographic or biometric data or SCD/SVD) or the TOE by altering data being sent to the TOE (like DTBS/R). The attacker does it in such a way that the Service Provider (represented by the terminal connected) or the TOE perceives these modified data as authentic one.

This item concerns the following application(s): ePassport, eID, eSign.

#### 82 **T.Abuse-Func** **Abuse of Functionality**

An attacker may use functions of the TOE which shall not be used in TOE operational phase in order (i) to manipulate or to disclosure the *User Data stored in the TOE*, (ii) to manipulate or to disclose the *TSF-data stored in the TOE* or (iii) to manipulate (bypass, deactivate or modify) *soft-coded security functionality of the TOE*. This threat addresses the misuse of the functions for the initialisation and personalisation in the operational phase after delivery to the RP\_Card

holder.

This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 30:* Details of the relevant attack scenarios depend, for instance, on the capabilities of the test features provided by the IC Dedicated Test Software being not specified here.

### 83 **T.Information\_Leakage**      **Information Leakage from RP\_Card**

An attacker may exploit information leaking from the TOE during its usage in order to disclose confidential *User Data* or/and *TSF-data stored on the RP\_Card* or/and *exchanged between the TOE and the service provider connected*. The information leakage may be inherent in the normal operation or caused by the attacker.

This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 31:* Leakage may occur through emanations, variations in power consumption, I/O characteristics, clock frequency, or by changes in processing time requirements. This leakage may be interpreted as a covert channel transmission, but is more closely related to measurement of operating parameters which may be derived either from measurements of the contactless interface (emanation) or direct measurements (by contact to the chip still available even for a contactless chip) and can then be related to the specific operation being performed. Examples are Differential Electromagnetic Analysis (DEMA) and Differential Power Analysis (DPA). Moreover the attacker may try actively to enforce information leakage by fault injection (e.g. Differential Fault Analysis).

### 84 **T.Phys-Tamper**                      **Physical Tampering**

An attacker may perform physical probing of the RP\_Card in order (i) to disclose the TSF-data, or (ii) to disclose/reconstruct the TOE's Embedded Software. An attacker may physically modify the RP\_Card in order to alter (i) its security functionality (hardware and software part, as well), (ii) the User Data or the TSF-data stored on the RP\_Card.

This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 32:* Physical tampering may be focused directly on the disclosure or manipulation of the user data (e.g. the biometric reference data for the inspection system) or the TSF data (e.g. authentication key of the RP\_Card) or indirectly by preparation of the TOE to following attack methods by modification of security features (e.g. to enable information leakage through power analysis). Physical tampering requires a direct interaction with the RP\_Card's internals. Techniques commonly employed in IC failure analysis and IC reverse engineering efforts may be used. Before that, hardware security mechanisms and layout characteristics need to be identified. Determination of software design including treatment of the user data and the TSF data may also be a pre-requisite. The modification may result in the deactivation of a security function. Changes of circuitry or data can be permanent or temporary.

### 85 **T.Malfunction**                      **Malfunction due to Environmental Stress**

An attacker may cause a malfunction the RP\_Card's hardware and Embedded Software by applying environmental stress in order to (i) deactivate or modify security features or functionality of the TOE' hardware or to (ii) circumvent, deactivate or modify security functions of the TOE's Embedded Software. This may be achieved e.g. by operating the RP\_Card outside the normal operating conditions, exploiting errors in the RP\_Card's Embedded Software or misusing administrative functions. To exploit these vulnerabilities an

attacker needs information about the functional operation.

This item concerns the following application(s): ePassport, eID, eSign.

*Application note 33:* A malfunction of the TOE may also be caused using a direct interaction with elements on the chip surface. This is considered as being a manipulation (refer to the threat T.Phys-Tamper) assuming a detailed knowledge about TOE's internals.

- 86 The current PP also includes all threats of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application.

Threat identifier from [6]	Equivalent to / covered by item in the current PP	Comments
T.Read_Sensitive_Data	T.Skimming	Sensitive biometric reference data (DG3, DG4) stored on the RP_Card are part of the asset <i>user data stored on the TOE</i> .

T.Sig_Forgery	-	-

**Table 7: Threats taken over from [8]**

- 89 *Application note 34*: The threat T.Hack\_Phys from the SSCD PP [8] is completely covered by the threat T.Phys-Tamper identified in the current PP: these items cover the same content. Hence, a parallel using both the items would not add anything to the security policy defined by the current PP. It means that the threat T.Phys-Tamper implicates the item T.Hack\_Phys. Therefore, in order to avoid multiple formal items for same content and to make the PP easier comprehensible, we explicitly use, where appropriate<sup>66</sup>, only the item of the current PP (for this example: T.Phys-Tamper), what implicitly includes the related item from the PP, to which the conformance claim has been made (for this example: T.Hack\_Phys). This approach will be applied throughout the current PP.

<sup>66</sup> A prerequisite for this is a complete coverage / equivalence of the items in question.

### 3.3 Organisational Security Policies

90 The TOE and/or its environment shall comply with the following Organisational Security Policies (OSP) as security rules, procedures, practices, or guidelines imposed by an organisation upon its operation.

91 **P.Pre-Operational**                      **Pre-operational handling of the RP\_Card**

- 1) The RP\_Card Issuer issues the RP\_Cards and approves using the terminals complying with all applicable laws and regulations.
- 2) The RP\_Card Issuer guarantees correctness of the user data (amongst other of those, concerning the RP\_Card holder) and of the TSF-data permanently stored in the TOE<sup>67</sup>.
- 3) The RP\_Card Issuer uses only such TOE's technical components (IC) which enable traceability of the RP\_Cards in their manufacturing and issuing life cycle phases, i.e. before they are in the operational phase, cf. sec. 1.2.3 above.
- 4) If the RP\_Card Issuer authorises a Personalisation Agent to personalise the RP\_Cards for RP\_Card holders, the RP\_Card Issuer has to ensure that the Personalisation Agent acts in accordance with the RP\_Card Issuer's policy.

This item concerns the following application(s): ePassport, eID, eSign.

92 **P.Card\_PKI**                                      **PKI for Chip and Passive Authentication (issuing branch)**<sup>68</sup>

*Application Note 35:* The description below states the responsibilities of involved parties and represents the logical, but not the physical structure of the PKI. Physical distribution ways shall be implemented by the involved parties in such a way that all certificates belonging to the PKI are securely distributed / made available to their final destination, e.g. by using directory services.

- 1) The RP\_Card Issuer shall establish a public key infrastructure for the passive authentication, i.e. for digital signature creation and verification for the RP\_Card. For this aim, he runs a Country Signing Certification Authority (CSCA). The RP\_Card Issuer shall make the CSCA Certificate (C<sub>CSCA</sub>) and the Document Signer Certificates (C<sub>DS</sub>) available to the CVCAs under agreement<sup>69</sup> (who shall finally distribute them to their rightful terminals).
- 2) The CSCA shall securely generate, store and use the CSCA key pair. The CSCA shall keep the CSCA Private Key secret and issue a self-signed CSCA Certificate (C<sub>CSCA</sub>) having to be made available to the RP\_Card Issuer by strictly secure means, see [9], 5.1.1. The CSCA shall create the Document Signer Certificates for the Document Signer Public Keys (C<sub>DS</sub>) and make them available to the RP\_Card Issuer, see [9], 5.5.1.
- 3) A Document Signer shall (i) generate the Document Signer Key Pair, (ii) hand over the Document Signer Public Key to the CSCA for certification, (iii) keep the Document Signer Private Key secret, (iv) securely use the Document Signer Private Key for signing the

---

<sup>67</sup> cf. Table 2 and Table 3 above

<sup>68</sup> Passive authentication using SO<sub>C</sub> is considered to be part of the chip authentication protocol within this PP.

<sup>69</sup> the form of such an agreement may be of formal and informal nature; the term 'agreement' is used in the current PP in order to reflect an appropriate relationship between the parties involved.

Card/Chip and Document Security Objects of RP\_Cards and (v) manage Chip Authentication Key Pairs  $\{SK_{PICC}, PK_{PICC}\}$  used for the chip authentication as defined in [12], sec. 4.3.<sup>70</sup>

This item concerns the following application(s): ePassport, eID, eSign.

### 93 P.Terminal\_PKI PKI for Terminal Authentication (receiving branch)

*Application Note 36:* The description below states the responsibilities of involved parties and represents the logical, but not the physical structure of the PKI. Physical distribution ways shall be implemented by the involved parties in such a way that all certificates belonging to the PKI are securely distributed / made available to their final destination, e.g. by using directory services.

- 1) The RP\_Card Issuer shall establish a public key infrastructure for the card verifiable certificates used for terminal authentication. For this aim, the RP\_Card Issuer shall run a domestic Country Verifying Certification Authority (domestic CVCA) and may use already existing foreign CVCA<sup>71</sup>. The RP\_Card Issuer shall make the CVCA Link Certificate available to the CSCA (who shall finally distribute it to its RP\_Cards).
- 2) A CVCA shall securely generate, store and use the CVCA key pair. A CVCA shall keep the CVCA Private Key secret and issue a self-signed CVCA Certificate ( $C_{CVCA}$ ) having to be made available to the RP\_Card Issuer by strictly secure means as well as to the respective Document Verifiers. A CVCA shall create the Document Verifier Certificates for Document Verifier Public Keys ( $C_{DV}$ ) and distribute them back to the respective Document Verifiers<sup>72</sup>.
- 3) A Document Verifier shall (i) generate the Document Verifier Key Pair, (ii) hand over the Document Verifier Public Key to the CVCA for certification, (iii) keep the Document Verifier Private Key secret and (iv) securely use the Document Verifier Private Key for signing the Terminal Certificates ( $C_T$ ) of the terminals being managed by him. The Document Verifier shall make  $C_T$ ,  $C_{DV}$  and  $C_{CVCA}$  available to the respective Service Provider (who puts them in his terminals)<sup>73</sup>.
- 4) A Service Provider shall (i) generate the Terminal Authentication Key Pairs  $\{SK_{PCD}, PK_{PCD}\}$ , (ii) hand over the Terminal Authentication Public Keys ( $PK_{PCD}$ ) to the DV for certification, (iii) keep the Terminal Authentication Private Keys ( $SK_{PCD}$ ) secret, (iv) securely use the Terminal Authentication Private Keys for the terminal authentication as defined in [12], sec. 4.4 and (v) install  $C_T$ ,  $C_{DV}$  and  $C_{CVCA}$  in the rightful terminals operated by him.

---

<sup>70</sup> A Document Signer shall also manage Restricted Identification Key Pairs  $\{SK_{ID}, PK_{ID}\}$  [12], sec. 2.4 and 4.5. The private Restricted Identification Key  $SK_{ID}$  shall be stored in the TOE, whereby the public Restricted Identification Key  $PK_{ID}$  – in a database of the DS. See also *Application note 6* and Table 2, object #1.

<sup>71</sup> In this case there shall be an appropriate agreement between the RP\_Card Issuer und a foreign CVCA ensuring enforcing the RP\_Card Issuer's privacy policy. Existence of such an agreement may technically be reflected by means of issuing a  $C_{CVCA-F}$  for the Public Key of the foreign CVCA signed by the domestic CVCA.

<sup>72</sup> A CVCA shall also manage a Revocation Sector Key Pair  $\{SK_{Revocation}, PK_{Revocation}\}$  [12], sec. 2.4 and 4.5. For Restricted Identification please see *Application note 6* and Table 2, object #1.

<sup>73</sup> A DV shall also manage Sector's Static Key Pairs  $\{SK_{SectorNN}, PK_{SectorNN}\}$  [12], sec. 2.4 and 4.5. For Restricted Identification please see *Application note 6* and Table 2, object #1.

This item concerns the following application(s): ePassport, eID, eSign.

**94 P.Trustworthy\_PKI      Trustworthiness of PKI**

- 1) The CSCA shall ensure that it issues its certificates exclusively to the rightful organisations (DS) and DSs shall ensure that they sign exclusively correct Card/Chip and Document Security Objects having to be stored on the RP\_Cards.
- 2) CVCAs shall ensure that they issue their certificates exclusively to the rightful organisations (DV) and DVs shall ensure that they issue their certificates exclusively to the rightful equipment (terminals)<sup>74</sup>.
- 3) CSPs shall ensure that they issue their certificates exclusively for the rightful data (public signature key of the RP\_Card holder)<sup>75</sup>.

This item concerns the following application(s): ePassport, eID, eSign.

**95 P.Terminal      Abilities and trustworthiness of rightful terminals**

- 1) Rightful terminals (BIS-PACE, EIS-AIP-BAC, EIS-GAP, authentication terminal and signature terminal, cf. Table 1 above) shall be used by Service Providers and by RP\_Card holders as defined in [12], sec. 3.2.
- 2) They shall implement either the terminal parts of the PACE protocol [12], sec. 4.2 (for BIS-PACE, EIS-GAP) or the terminal parts of the BAC protocol [12], sec. H (for EIS-AIP-BAC), of the Terminal Authentication protocol [12], sec. 4.4, of the Passive Authentication with SO<sub>C</sub> [12], sec. 3.4, of the Chip Authentication protocol [12], sec. 4.3<sup>76</sup> and of the Passive Authentication with SO<sub>D</sub> [12], sec. 1.1 and use them – dependent on the type of terminal – in the order as required by [12], sec. 3.1.1 and 3.2. A rightful terminal shall use randomly and (almost) uniformly selected nonces, if required by the protocols (for generating ephemeral keys for Diffie-Hellmann).
- 3) Rightful terminals shall store the related credentials needed for the terminal authentication<sup>77</sup> (terminal authentication key pair {SK<sub>PCD</sub>, PK<sub>PCD</sub>} and the terminal certificate (C<sub>T</sub>) over PK<sub>PCD</sub> issued by the DV related as well as C<sub>DV</sub> and C<sub>CVCA</sub>; the terminal certificate includes an authorisation mask (CHAT) for access to the data stored on the RP\_Card) in order to enable and to perform the terminal authentication as defined in [12], sec. 4.4.
- 4) They shall also store the Country Signing Public Key and the Document Signer Public Key (in form of C<sub>CSCA</sub> and C<sub>DS</sub>) in order to enable and to perform Passive Authentication with SO<sub>C</sub> (determination of the authenticity of PK<sub>PICC</sub>, [12], sec. 4.3.1.2) and SO<sub>D</sub> (determination of the authenticity of the data groups stored in the *ePassport*, [12], sec. 1.1).

---

<sup>74</sup> This rule is relevant for T.Skimming

<sup>75</sup> This property is affine to P.CSP\_QCert from [8].

<sup>76</sup> The Passive Authentication with SO<sub>C</sub> is considered to be part of the Chip Authentication (CA) Protocol within this PP.

<sup>77</sup> not applicable to any BIS (here: BIS-PACE)

- 5) A rightful terminal must not send assets (e.g. eSign-PIN, DTBS) to the TOE within the PACE session, but first having successfully performed the Chip Authentication after the Terminal Authentication<sup>78</sup>.
- 6) A rightful terminal and its environment shall ensure confidentiality and integrity of respective data handled by it (e.g. confidentiality of PINs/PUKs, CAN and MRZ, integrity of PKI certificates and DTBS, etc.), where it is necessary for a secure operation of the TOE according to the current PP.

This item concerns the following application(s): ePassport, eID, eSign.

- 96 The current PP also includes all OSPs of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application.

OSP identifier from [6]	Equivalent to / covered by item in the current PP	Comments
P.BAC-PP	-	-

**Table 10: OSPs taken over from [8]**

### 3.4 Assumptions

- 99 The assumptions describe the security aspects of the environment in which the TOE will be used or is intended to be used.
- 100 The current PP includes all assumptions of the ICAO-EAC PP [6] (please regard the *Application note 13* above). Formally, they only concern the *ePassport* application.

Assumption identifier from [6]	Equivalent to / covered by item in the current PP	Comments (some notions in this column are used as in [6] for better comparability)
A.MRTD_Manufact	ALC_DVS.2, see sec. 6.2 below	Such a kind of assumptions is always automatically covered by a component of the assurance family ALC_DVS, if chosen.
A.MRTD_Delivery	ALC_DEL.1, see sec. 6.2 below	Such a kind of assumptions is always automatically covered by a component of the assurance family ALC_DEL, if chosen.

Assumption identifier from [6]	Equivalent to / covered by item in the current PP	Comments (some notions in this column are used as in [6] for better comparability)
A.Pers_Agent	P.Pre-Operational  P.Card_PKI	P.Pre-Operational covers ensuring the correctness of the logical MRTD with respect to the MRTD holder  P.Card_PKI covers ensuring the correctness of keys and certificates stored on the MRTD's chip and signing the Document Security Object (SO <sub>D</sub> ).
A.Insp_Sys	P.Terminal_PKI  P.Terminal	P.Terminal_PKI covers availability of keys and certificates stored in the inspection system  P.Terminal covers supporting necessary authentication protocols according to [12].
A.Signature_PKI	P.Card_PKI	-
A.Auth_PKI	P.Terminal_PKI	-

**Table 11: Assumptions taken over from [6]**

*Application note 37:* Assumptions A.MRTD\_Manufact and A.MRTD\_Delivery from [6] address manufacturing, testing and delivery aspects. Fulfillment of such assumptions is a necessary condition for a 'pass' judgement by applying the chosen assurance components ALC\_DVS.2 and ALC\_DEL.1, respectively. It means that if the respective assurance components ALC\_DVS.2 and ALC\_DEL.1 have positively been judged, the fulfilment of these assumptions is 'automatically' ensured: the manufacturer is required and responsible for applying all the related procedures with respect to the TOE.

Therefore, the assumptions A.MRTD\_Manufact and A.MRTD\_Delivery are implicitly included into the current PP by choosing the assurance components ALC\_DVS.2 and ALC\_DEL.1.

The remaining assumptions from [6] A.Pers\_Agent, A.Insp\_Sys, A.Signature\_PKI and A.Auth\_PKI are completely covered by the respective items (OSPs) defined in the current PP.

Hence, according to the *Application note 34* above, we will explicitly use the items of the current PP.

101 The current PP includes all assumptions of the PACE-Pass PP [7]: they represent an empty set.

102 The current PP includes all assumptions of the SSCD PP [8] (please regard the *Application note 19* and Table 1 above). These items are applicable, if the *eSign* application is operational. Formally, they only concern the *eSign* application.

Assumption identifier [8]	Equivalent to / covered by item in the current PP	Comments
A.CGA	-	This item concerns not only qualified, but also non-qualified certificates, cf. <i>Application note 11</i> above – remark of the

Assumption identifier [8]	Equivalent to / covered by item in the current PP	Comments
		author
A.SCA	P.Terminal (partially)	P.Terminal covers using trustworthy SCAs.  Additionally, the SCA shall generate and send the DTBS/R to the TOE.

**Table 12: Assumptions taken over from [8]**

103 The current PP does not include any additional, ‘own’ assumptions. Hence, as a result of the current section, there are explicitly only two assumptions within the current PP: A.CGA and A.SCA being exclusively applicable to the eSign application of the TOE.

## 4 Security Objectives

104 This chapter describes the security objectives for the TOE and the security objectives for the TOE environment.

### 4.1 Security Objectives for the TOE

105 The following TOE security objectives address the protection provided by the TOE *independent* of TOE environment.

#### 106 OT.Data\_Integrity      Integrity of Data

The TOE must ensure integrity of the User Data and the TSF-data<sup>79</sup> stored on it by protecting these data against unauthorised modification (physical manipulation and unauthorised modifying).

The TOE must ensure integrity of the User Data and the TSF-data<sup>79</sup> during their exchange between the TOE and the Service Provider connected (and represented by either BIS-PACE, EIS-AIP-BAC, EIS-GAP or ATT or SGT) after the PACE Authentication as well as the Terminal- and the Chip Authentication.

This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 38:* A product using BIS-BAC cannot achieve this objective either for stored or being transmitted data in the context of the security policy defined in this PP. When using EIS-AIP-BAC, this objective is confined to only selected data groups (DG3, DG4) within the ePassport application, see also the *Application Note 25* above.

#### 107 OT.Data\_Authenticity      Authenticity of Data

The TOE must ensure authenticity of the User Data and the TSF-data<sup>80</sup> stored on it by enabling verification of their authenticity at the terminal-side<sup>81</sup>.

The TOE must ensure authenticity of the User Data and the TSF-data<sup>80</sup> during their exchange between the TOE and the Service Provider connected (and represented by either BIS-PACE, EIS-AIP-BAC, EIS-GAP or ATT or SGT) after the PACE Authentication as well as the Terminal- and the Chip Authentication. It shall happen by enabling such a verification at the terminal-side (at receiving by the terminal) and by an active verification by the TOE itself (at receiving by the TOE)<sup>82</sup>.

This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 39:* A product using BIS-BAC cannot achieve this objective either for stored or being transmitted data in the context of the security policy defined in this PP. When using EIS-AIP-BAC, this objective is confined to only selected data groups (DG3, DG4) within the ePassport application, see also the *Application Note 25* above.

#### 108 OT.Data\_Confidentiality      Confidentiality of Data

---

<sup>79</sup> where appropriate, see Table 3 above

<sup>80</sup> where appropriate, see Table 3 above

<sup>81</sup> verification of SO<sub>C</sub>

<sup>82</sup> secure messaging after the PACE authentication, see also [12], sec. 4.2.2 as well as after the chip authentication, see also [12], sec. 4.4.2

The TOE must ensure confidentiality of the User Data and the TSF-data<sup>83</sup> by granting read access only to authorised rightful terminals (BIS-PACE, EIS-AIP-BAC, EIS-GAP, ATT, SGT) according to the effective terminal authorisation level (CHAT)<sup>84</sup> presented by the terminal connected<sup>85</sup>.

The TOE must ensure confidentiality of the User Data and the TSF-data<sup>83</sup> during their exchange between the TOE and the Service Provider connected (and represented by either BIS-PACE, EIS-AIP-BAC, EIS-GAP or ATT or SGT) after the PACE Authentication as well as the Terminal- and the Chip Authentication.

This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 40:* A product using BIS-BAC cannot achieve this objective in the context of the security policy defined in this PP. When using EIS-AIP-BAC, this objective is confined to only selected data groups (DG3, DG4) within the ePassport application, see also the *Application Note 25* and *Application Note 27* above.

#### 109 OT.Tracing                      Tracing RP\_Card

The TOE must prevent gathering TOE tracing data by means of unambiguous identifying the RP\_Card remotely through establishing or listening to a communication via the contactless interface of the TOE without knowledge of the correct values of shared passwords (CAN, MRZ, eID-PIN, eID-PUK) in advance.

This item concerns the following application(s): ePassport, eID, eSign.

*Application Note 41:* A product using BAC (whatever the type of the inspection system is: BIS-BAC or EIS-AIP-BAC) cannot achieve this objective in the context of the security policy defined in this PP. Hence, this objective is considered not to be allied with using EIS-AIP-BAC, see also the *Application Note 28* above.

#### 110 OT.Chip\_Auth\_Proof      Proof of RP\_Card authenticity

The TOE must enable the terminal connected to verify the authenticity of the RP\_Card as a whole device as issued by the RP\_Card Issuer (issuing PKI branch of the RP\_Card Issuer) by means of the Passive (using SO<sub>C</sub>) and Chip Authentication as defined in [12], sec. 4.3.

This item concerns the following application(s): ePassport, eID, eSign.

*Application note 42:* The OT.Chip\_Auth\_Proof implies the RP\_Card's chip to have a unique secret to prove its authenticity by knowledge, i.e. a Chip Authentication Private Key as TSF-data.

The terminal shall have the reference data to verify the authentication attempt of the RP\_Card's chip, i.e. a certificate for the respective Chip Authentication Public Key (PK<sub>PICC</sub>) fitting to the Chip Authentication Private Key (SK<sub>PICC</sub>). This certificate is provided by (i) the Chip Authentication Public Key stored on the TOE and (ii) the hash value of this PK<sub>PICC</sub> in the Card/Chip Security Object (SO<sub>C</sub>) signed by the Document Signer.

<sup>83</sup> where appropriate, see Table 3 above

<sup>84</sup> CHAT is not applicable to BIS (here: BIS-PACE). For BIS-PACE, table 1.2 in sec. 1.1 of [12] (column PACE) shall be applied.

<sup>85</sup> The authorisation of the terminal connected (CHAT) is drawn from the terminal certificate chain used for the successful terminal authentication as defined in [12], sec. 4.4 and shall be a non-strict subset of the authorisation defined in the Terminal Certificate (C<sub>T</sub>), the Document Verifier Certificate (C<sub>DV</sub>) and the C<sub>CVCA</sub> in the certificate chain up to the Country Verifying Certification Authority of the RP\_Card Issuer (receiving PKI branch of the RP\_Card Issuer). The effective terminal authorisation can additionally be restricted by the RP\_Card holder by a respective input at the terminal.

*Application Note 43:* Since the Standard Inspection Procedure does not support any unique-secret-based authentication of the chip (no Chip Authentication), a product using Basic Inspection System (whatever the used protocol is: BAC or PACE) cannot achieve this objective in the context of the security policy defined in this PP. Hence, this objective is considered not to be allied with using BIS-PACE, see also the *Application Note 29* above.

#### 111 OT.Prot\_Abuse-Func      Protection against Abuse of Functionality

The TOE must prevent that functions of the TOE, which may not be used in TOE operational phase, can be abused in order (i) to manipulate or to disclose the User Data stored in the TOE, (ii) to manipulate or to disclose the TSF-data stored in the TOE, (iii) to manipulate (bypass, deactivate or modify) soft-coded security functionality of the TOE.

This item concerns the following application(s): ePassport, eID, eSign.

#### 112 OT.Prot\_Inf\_Leak      Protection against Information Leakage

The TOE must provide protection against disclosure of confidential User Data or/and TSF-data stored and/or processed by the RP\_Card

- by measurement and analysis of the shape and amplitude of signals or the time between events found by measuring signals on the electromagnetic field, power consumption, clock, or I/O lines,
- by forcing a malfunction of the TOE and/or
- by a physical manipulation of the TOE.

This item concerns the following application(s): ePassport, eID, eSign.

*Application note 44:* This objective pertains to measurements with subsequent complex signal processing due to normal operation of the TOE or operations enforced by an attacker.

#### 113 OT.Prot\_Phys-Tamper      Protection against Physical Tampering

The TOE must provide protection of confidentiality and integrity of the User Data, the TSF-data and the RP\_Card's Embedded Software by means of

- measuring through galvanic contacts representing a direct physical probing on the chip's surface except on pads being bonded (using standard tools for measuring voltage and current) or
- measuring not using galvanic contacts, but other types of physical interaction between electrical charges (using tools used in solid-state physics research and IC failure analysis),
- manipulation of the hardware and its security functionality, as well as
- controlled manipulation of memory contents (User Data, TSF-data)

with a prior

- reverse-engineering to understand the design and its properties and functionality.

This item concerns the following application(s): ePassport, eID, eSign.

#### 114 OT.Prot\_Malfunction      Protection against Malfunctions

The TOE must ensure its correct operation. The TOE must prevent its operation outside the normal operating conditions where reliability and secure operation have not been proven or

tested. This is to prevent functional errors in the TOE. The environmental conditions may include external energy (esp. electromagnetic) fields, voltage (on any contacts), clock frequency or temperature.

This item concerns the following application(s): ePassport, eID, eSign.

115 The following TOE security objectives address the aspects of identified threats to be countered *involving TOE's environment*.

**116 OT.Identification Identification of the TOE**

The TOE must provide means to store Initialisation<sup>86</sup> and Pre-Personalisation Data in its non-volatile memory. The Initialisation Data must provide a unique identification of the IC during the manufacturing and the card issuing life cycle phases of the RP\_Card.

This item concerns the following application(s): ePassport, eID, eSign.

**117 OT.Personalisation Personalisation of RP\_Card**

The TOE must ensure that the user data (amongst other those concerning the RP\_Card holder<sup>87</sup>) and the TSF-data permanently stored in the TOE can be written by authorised Personalisation Agents only. The Card/Chip and Document Security Objects can be updated by authorised Personalisation Agents (in the role of DS), if the related data have been modified. The optional *eSign* application can additionally be activated on the TOE on behalf of the CSP issuing this *eSign* application, if the RP\_Card holder had applied for this.

This item concerns the following application(s): ePassport, eID, eSign.

118 The current PP also includes all security objectives for the TOE of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application.

Objective identifier from [6]	Equivalent to / covered by item in the current PP	Comments
OT.AC_Pers	OT.Personalisation	-
OT.Data_Int	OT.Data_Integrity	-
OT.Sens_Data_Conf	OT.Data_Confidentiality	DG3 and DG4 in the ePassport application are part of the User Data in the sense of the current PP.

**Table 15: TOE objectives taken over from [8]**

## 4.2 Security Objectives for Operational Environment

### I. RP\_Card Issuer as the general responsible

121 The RP\_Card Issuer as the general responsible for the global security policy related will implement the following security objectives for the TOE environment:

#### 122 OE.Legislative\_Compliance

The RP\_Card Issuer must issue the RP\_Cards and approve using the terminals complying with all applicable laws and regulations.

This item concerns the following application(s): ePassport, eID.

### II. RP\_Card Issuer and CSCA: RP\_Card's PKI (issuing) branch

123 The RP\_Card Issuer and the related CSCA will implement the following security objectives for the TOE environment (see also the *Application Note 35* above):

#### 124 OE.Passive\_Auth\_Sign Authentication of RP\_Card by Signature

The RP\_Card Issuer has to establish the necessary public key infrastructure as follows: the CSCA acting on behalf and according to the policy of the RP\_Card Issuer must (i) generate a cryptographically secure CSCA Key Pair, (ii) ensure the secrecy of the CSCA Private Key and sign Document Signer Certificates in a secure operational environment, and (iii) make the Certificate of the CSCA Public Key ( $C_{CSCA}$ ) and the Document Signer Certificates ( $C_{DS}$ ) available to the RP\_Card Issuer, who makes them available to his own (domestic) CVCA as well as to the foreign CVCA's under agreement<sup>88</sup>. Hereby authenticity and integrity of these certificates are being maintained.

A Document Signer acting in accordance with the CSCA policy must (i) generate a cryptographically secure Document Signing Key Pair, (ii) ensure the secrecy of the Document Signer Private Key, (iii) hand over the Document Signer Public Key to the CSCA for certification, (iv) sign Card/Chip and Document Security Objects of genuine RP\_Cards in a secure operational environment only. The digital signature in the Card/Chip Security Object relates to all security information objects according to [12], Appendix A.

The CSCA must issue its certificates exclusively to the rightful organisations (DS) and DSs must sign exclusively correct Card/Chip and Document Security Objects having to be stored on RP\_Cards.

This item concerns the following application(s): ePassport, eID.

#### 125 OE.Chip\_Auth\_Key      Chip Authentication Key

A Document Signer acting in accordance with the CSCA policy has to (i) generate the RP\_Card's Chip Authentication Key Pair  $\{SK_{PICC}, PK_{PICC}\}$  used for the chip authentication as defined in [12], sec. 4.3, (ii) sign and store the Chip Authentication Public Key in the Chip Authentication Public Key Info (Appendix A of [12]) and (iii) support Service Providers to verify the authenticity of the RP\_Card's chips used for genuine RP\_Cards by certification of the Chip Authentication Public Key by means of the Card/Chip Security Object.

A Document Signer has also to manage Restricted Identification Key Pairs  $\{SK_{ID}, PK_{ID}\}$  [12], sec. 2.4 and 4.5: the private Restricted Identification Key  $SK_{ID}$  is to store in the TOE, whereby the public Restricted Identification Key  $PK_{ID}$  – in a database of the DS. See also *Application note 6* and Table 2, object #1.

This item concerns the following application(s): ePassport, eID.

#### 126 OE.Personalisation      Personalisation of RP\_Card

The RP\_Card Issuer must ensure that the Personalisation Agents acting on his behalf (i) establish the correct identity of the RP\_Card holder and create the biographical data for the RP\_Card<sup>89</sup>, (ii) enrol the biometric reference data of the RP\_Card holder<sup>90</sup>, (iii) write a subset of these data on the physical Residence Permit Card (optical personalisation) and store them in the RP\_Card (electronic personalisation) for the RP\_Card holder as defined in [12], (iv) write the document details data, (v) write the initial TSF data, (vi) sign the Card/Chip and Document Security Objects defined in [12] (in the role of a DS).

This item concerns the following application(s): ePassport, eID.

---

<sup>88</sup> CVCA's represent the roots of receiving branch, see below

<sup>89</sup> relevant for the ePassport, the eID and the eSign applications

<sup>90</sup> relevant for the ePassport application

### III. RP\_Card Issuer and CVCA: Terminal's PKI (receiving) branch

127 The RP\_Card Issuer and the related domestic CVCA as well as the foreign CVCA's under agreement (with the RP\_Card Issuer)<sup>91</sup> will implement the following security objectives for the TOE environment (see also the *Application Note 36* above):

#### 128 OE.Terminal\_Authentication      Authentication of rightful terminals

The RP\_Card Issuer has to establish the necessary public key infrastructure as follows: the domestic CVCA acting on behalf and according to the policy of the RP\_Card Issuer as well as each foreign CVCA acting under agreement with the RP\_Card Issuer and according to its policy must (i) generate a cryptographically secure CVCA Key Pair, (ii) ensure the secrecy of the CVCA Private Key and sign Document Verifier Certificates in a secure operational environment, (iii) make the Certificate of the CVCA Public Key ( $C_{CVCA}$ ) available to the RP\_Card Issuer (who make it available to his own CSCA<sup>92</sup>) as well as to the respective Document Verifiers, (iv) distribute Document Verifier Certificates ( $C_{DV}$ ) back to the respective Document Verifiers. Hereby authenticity and integrity of these certificates are being maintained. A CVCA has also to manage a Revocation Sector Key Pair  $\{SK_{Revocation}, PK_{Revocation}\}$  [12], sec. 2.4 and 4.5<sup>93</sup>.

A Document Verifier acting in accordance with the respective CVCA policy must (i) generate a cryptographically secure Document Verifying Key Pair, (ii) ensure the secrecy of the Document Verifying Private Key, (iii) hand over the Document Verifier Public Key to the respective CVCA for certification, (iv) sign the Terminal Certificates ( $C_T$ ) of the terminals being managed by him in a secure operational environment only, and (v) make  $C_T$ ,  $C_{DV}$  and  $C_{CVCA}$  available to the respective Service Providers operating the terminals certified. This certificate chain contains, amongst other, the authorisation level of pertained terminals for differentiated data access on the RP\_Card. A DV has also to manage Sector's Static Key Pairs  $\{SK_{SectorNN}, PK_{SectorNN}\}$  [12], sec. 2.4 and 4.5<sup>94</sup>.

A Service Provider participating in this PKI (and, hence, acting in accordance with the policy of the related DV) must (i) generate Terminal Authentication Key Pairs  $\{SK_{PCD}, PK_{PCD}\}$ , (ii) ensure the secrecy of Terminal Authentication Private Keys, (iii) hand over the Terminal Authentication Public Keys  $\{PK_{PCD}\}$  to the DV for certification, (iv) securely use the Terminal Authentication Private Keys for the terminal authentication as defined in [12], sec. 4.4 and (v) install  $C_T$ ,  $C_{DV}$  and  $C_{CVCA}$  in the rightful terminals operated by him.

CVCA's must issue their certificates exclusively to the rightful organisations (DV) and DVs must issue their certificates exclusively to the rightful equipment (terminals)<sup>95</sup>.

This item concerns the following application(s): ePassport, eID.

#### 129 OE.Terminal      Terminal operating

The Service Providers participating in the current PKI (and, hence, acting in accordance with the policy of the related DV) must operate their terminals as follows:

- 1) They use their terminals (BIS-PACE, EIS-AIP-BAC, EIS-GAP, authentication or signature terminals, cf. Table 1 above) as defined in [12], sec. 3.2.

<sup>91</sup> the form of such an agreement may be of formal and informal nature; the term 'agreement' is used in the current PP in order to reflect an appropriate relationship between the parties involved.

<sup>92</sup> CSCA represents the root of the issuing branch, see above.

<sup>93</sup> For Restricted Identification please see *Application note 6* and Table 2, object #1

<sup>94</sup> For Restricted Identification please see *Application note 6* and Table 2, object #1.

<sup>95</sup> This rule is relevant for T.Skimming

- 2) Their terminals implement the terminal parts of the PACE protocol [12], sec. 4.2 (for BIS-PACE, EIS-GAP) or the terminal parts of the BAC protocol [12], sec. H (for EIS-AIP-BAC), of the Terminal Authentication protocol [12], sec. 4.4, of the Passive Authentication with  $SO_C$  [12], sec. 3.4 (by verification of the signature of the Card/Chip Security Object), of the Chip Authentication protocol [12], sec. 4.3<sup>96</sup> and of the Passive Authentication with  $SO_D$  [12], sec. 1.1 and use them – dependent on the type of terminal – in the order as required by [12], sec. 3.1.1 and 3.2. A rightful terminal uses randomly and (almost) uniformly selected nonces, if required by the protocols (for generating ephemeral keys for Diffie-Hellmann).
- 3) Their terminals securely store the related credentials needed for the terminal authentication<sup>97</sup> (terminal authentication key pair  $\{SK_{PCD}, PK_{PCD}\}$  and the terminal certificate ( $C_T$ ) over  $PK_{PCD}$  issued by the DV related as well as  $C_{DV}$  and  $C_{CVCA}$ ; the terminal certificate includes the authorisation mask (CHAT) for access to the data stored on the RP\_Card) in order to enable and to perform the terminal authentication as defined in [12], sec. 4.4.
- 4) Their terminals securely store the Country Signing Public Key and the Document Signer Public Key (in form of  $C_{CSCA}$  and  $C_{DS}$ ) in order to enable and to perform Passive Authentication with  $SO_C$  of the RP\_Card (determination of the authenticity of  $PK_{PICC}$ , [12], sec. 4.3.1.2) and  $SO_D$  (determination of the authenticity of the data groups stored in the *ePassport*, [12], sec. 1.1).
- 5) Their terminals must not send assets (e.g. eSign-PIN, DTBS) to the TOE within the PACE session, but first having successfully performed the Chip Authentication after the Terminal Authentication<sup>98</sup>.
- 6) Their terminals and its environment must ensure confidentiality and integrity of respective data handled by it (e.g. confidentiality of PINs/PUKs, CAN and MRZ, integrity of PKI certificates and DTBS, etc.), where it is necessary for a secure operation of the TOE according to the current PP.

This item concerns the following application(s): ePassport, eID.

#### IV. RP\_Card holder Obligations

##### 130 OE.Card-Holder

##### RP\_Card holder Obligations

The RP\_Card Holder has to keep his or her verification values of eID-PIN and eID-PUK secret. The RP\_Card Holder may reveal, if necessary, his or her verification values of CAN and MRZ to an authorised person or device who definitely act according to respective regulations and are trustworthy.

This item concerns the following application(s): ePassport, eID.

---

<sup>96</sup> The Passive Authentication with  $SO_C$  is considered to be part of the Chip Authentication (CA) Protocol within this PP

<sup>97</sup> not applicable to any BIS (here: BIS-PACE)

<sup>98</sup> This rule is relevant for T.Skimming

- 131 The current PP also includes all security objectives for the TOE's environment of the ICAO-EAC PP [6] (please regard the *Application note 20*). Formally, they only concern the *ePassport* application.

### 4.3 Security Objective Rationale

135 The following table provides an overview for security objectives coverage (TOE and its environment) also giving an evidence for *sufficiency* and *necessity* of the objectives defined. It shows that all threats and OSPs are addressed by the security objectives. It also shows that all assumptions are addressed by the security objectives for the TOE environment.

	OT.Identification	OT.Personalisation	OT.Data_Integrity	OT.Data_Authenticity	OT.Data_Confidentiality	OT.Tracing	OT.Chip_Auth_Proof	OT.Prot_Abuse-Func	OT.Prot_Inf_Leak	OT.Prot_Phys-Tamper	OT.Prot_Malfunction	OE.Personalisation	OE.Passive_Auth_Sign	OE.Chip_Auth_Key	OE.Terminal_Authentication	OE.Terminal	OE.Card-Holder	OE.Legislative_Compliance	OE.CGA_QCcert ([8]) <sup>100</sup>

**Table 20: Security Objective Rationale**

136 A detailed justification required for *suitability* of the security objectives to coup with the security problem definition is given below.

137 The threat **T.Skimming** addresses accessing the User Data (stored on the TOE or transferred between the TOE and the Service Provider) using the TOE's contactless interface. This threat is countered by the security objectives OT.Data\_Integrity, OT.Data\_Authenticity and OT.Data\_Confidentiality through the Terminal- and the Chip Authentication. The objective OE.Terminal\_Authentication sets a prerequisite up for an effective terminal authentication (its property 'CVCAs must issue their certificates exclusively to the rightful organisations (DV) and DV must issue their certificates exclusively to the rightful equipment (terminals)'). The objective OE.Terminal sets a prerequisite up that no assets will be transferred between the TOE and the Service Provider before the Chip Authentication has successfully been accomplished (in its property 'Their (Service Provider's – remark of the author) terminals must not send assets (e.g. eSign-PIN, DTBS) to the TOE within the PACE session, but first having successfully performed the chip authentication'). The objective OE.Card-Holder ensures that a PACE session can only be

<sup>100</sup> This item is applicable, if the *eSign* application is operational.

- established either by the RP\_Card holder itself or by an authorised person or device, and, hence, cannot be captured by an attacker.
- 138 The threat **T.Eavesdropping** addresses listening to the communication between the TOE and a rightful terminal in order to gain the User Data transferred there. This threat is countered by the security objective OT.Data\_Confidentiality through a trusted channel based on the Chip Authentication.
- 139 The threat **T.Tracing** addresses gathering TOE tracing data identifying it remotely by establishing or listening to a communication via the contactless interface of the TOE, whereby the attacker does not a priori know the correct values of CAN, MRZ, eID-PIN and eID-PUK). This threat is directly countered by security objectives OT.Tracing (no gathering TOE tracing data) and OE.Card-Holder (the attacker does not a priori know the correct values of the shared passwords).
- 140 The threat **T.Counterfeit** addresses the attack of unauthorised copy or reproduction of the genuine RP\_Card. This attack is countered by the chip authenticity proof as aimed by OT.Chip\_Auth\_Proof using a chip authentication key pair to be generated within the issuing PKI branch as aimed by OE.Chip\_Auth\_Key. According to OE.Terminal the Service Provider's terminals has to perform the Chip Authentication Protocol to verify the authenticity of the RP\_Card.
- 141 The threat **T.Forgery** addresses the fraudulent, complete or partial alteration of the User Data or/and TSF-data stored on the TOE or/and exchanged between the TOE and the Service Provider. The security objective OT.Personalisation requires the TOE to limit the write access for the RP\_Card to the trustworthy Personalisation Agent (cf. OE.Personalisation). The TOE will protect the integrity and authenticity of the stored and exchanged User Data or/and TSF-data as aimed by the security objectives OT.Data\_Integrity and OT.Data\_Authenticity, respectively. The objectives OT.Prot\_Phys-Tamper and OT.Prot\_Abuse-Func contribute to protecting integrity of the User Data or/and TSF-data stored on the TOE. A Service Provider operating his terminals according to OE.Terminal and performing the Passive Authentication using the Card/Chip Security Object as aimed by OE.Passive\_Auth\_Sign will be able to effectively verify integrity and authenticity of the data received from the TOE.
- 142 The threat **T.Abuse-Func** addresses attacks of misusing TOE's functionality to manipulate or to disclosure the stored User- or TSF-data as well as to disable or to bypass the soft-coded security functionality. The security objective OT.Prot\_Abuse-Func ensures that the usage of functions having not to be used in the operational phase is effectively prevented.
- 143 The threats **T.Information\_Leakage**, **T.Phys-Tamper** and **T.Malfunction** are typical for integrated circuits like smart cards under direct attack with high attack potential. The protection of the TOE against these threats is obviously addressed by the directly related security objectives OT.Prot\_Inf\_Leak, OT.Prot\_Phys-Tamper and OT.Prot\_Malfunction, respectively.
- 144 The OSP **P.Pre-Operational** is enforced by the following security objectives:  
OT.Identification is affine to the OSP's property 'traceability before the operational phase';  
OT.Personalisation and OE.Personalisation together enforce the OSP's properties 'correctness of the User- and the TSF-data stored' and 'authorisation of Personalisation Agents';  
OE.Legislative\_Compliance is affine to the OSP's property 'compliance with laws and regulations'.
- 145 The OSP **P.Terminal** is obviously enforced by the objective OE.Terminal, whereby the one-to-one mapping between the related properties is applicable.

- 146 The OSP **P.Card\_PKI** is enforced by establishing the issuing PKI branch as aimed by the objectives OE.Passive\_Auth\_Sign (for the Card/Chip Security Object) and OE.Chip\_Auth\_Key (for managing the RP\_Card's Chip Authentication Key Pairs).
- 147 The OSP **P.Terminal\_PKI** is enforced by establishing the receiving PKI branch as aimed by the objective OE.Terminal\_Authentication.
- 148 The OSP **P.Trustworthy\_PKI** is enforced by OE.Passive\_Auth\_Sign (for CSCA, issuing PKI branch), by OE.Terminal\_Authentication (for CVCA, receiving PKI branch) and by OE.CGA\_QCert (see [8]).
- 149 The rationale related to the security objectives taken over from [6], [7] and [8] are exactly the same as given for the respective items of the security policies definitions in sec. 4.3 of [6], sec. 4.3 of [7] and sec. 8.4 of [8], respectively.

## 5 Extended Components Definition

150 This protection profile uses components defined as extensions to CC part 2. They are drawn from [6] and [7].

### 5.1 Definition of the Family FAU\_SAS

151 To describe the security functional requirements of the TOE, the family FAU\_SAS of the class FAU (Security audit) is defined here. This family describes the functional requirements for the storage of audit data. It has a more general approach than FAU\_GEN, because it does not necessarily require the data to be generated by the TOE itself and because it does not give specific details of the content of the audit records.

152 The family 'Audit data storage (FAU\_SAS)' is specified as follows:

#### **FAU\_SAS Audit data storage**

Family behaviour

This family defines functional requirements for the storage of audit data.

Component levelling

FAU\_SAS Audit data storage

1

FAU\_SAS.1 Requires the TOE to provide the possibility to store audit data.

Management: FAU\_SAS.1

There are no management activities foreseen.

Audit: FAU\_SAS.1

There are no actions defined to be auditable.

#### **FAU\_SAS.1 Audit storage**

Hierarchical to: No other components

Dependencies: No dependencies

FAU\_SAS.1.1 The TSF shall provide [assignment: *authorised users*] with the capability to store [assignment: *list of audit information*] in the audit records.

### 5.2 Definition of the Family FCS\_RND

153 To describe the IT security functional requirements of the TOE, the family FCS\_RND of the class FCS (Cryptographic support) is defined here. This family describes the functional requirements for random number generation used for cryptographic purposes. The component FCS\_RND.1 is

not limited to generation of cryptographic keys unlike the component FCS\_CKM.1. The similar component FIA\_SOS.2 is intended for non-cryptographic use.

154 The family ‘Generation of random numbers (FCS\_RND)’ is specified as follows:

### **FCS\_RND Generation of random numbers**

Family behaviour

This family defines quality requirements for the generation of random numbers intended to be used for cryptographic purposes.

Component levelling:

FCS\_RND.1      Generation of random numbers requires that random numbers meet a defined quality metric.

Management:      FCS\_RND.1

There are no management activities foreseen.

Audit:      FCS\_RND.1

There are no actions defined to be auditable.

### **FCS\_RND.1      Quality metric for random numbers**

Hierarchical to:      No other components

Dependencies:      No dependencies

FCS\_RND.1.1      The TSF shall provide a mechanism to generate random numbers that meet [assignment: *a defined quality metric*].

## **5.3 Definition of the Family FIA\_API**

155 To describe the IT security functional requirements of the TOE, the family FIA\_API of the class FIA (Identification and authentication) is defined here. This family describes the functional requirements for proof of the claimed *identity* for the authentication verification by an external entity, where the other families of the class FIA address the verification of the identity of an external entity.

156 *Application note 46:* Other families of the class FIA describe only the authentication verification of user's identity performed by the TOE and do not describe the functionality of the TOE to prove its own identity. The following paragraph defines the family FIA\_API in the style of the Common Criteria part 2 (cf. [3], chapter ‘Extended components definition (APE\_ECD)’ from a TOE point of view.

### **FIA\_API Authentication Proof of Identity**

### Family behaviour

This family defines functions provided by the TOE to prove its identity and to be verified by an external entity in the TOE IT environment.

### Component levelling:

FIA\_API.1 Authentication Proof of Identity.

Management: FIA\_API.1

The following actions could be considered for the management functions in FMT: Management of authentication information used to prove the claimed identity.

Audit: FIA\_API.1

There are no actions defined to be auditable.

### **FIA\_API.1 Authentication Proof of Identity**

Hierarchical to: No other components

Dependencies: No dependencies

FIA\_API.1.1 The TSF shall provide a [assignment: *authentication mechanism*] to prove the identity of the [assignment: *authorised user or role*].

## 5.4 Definition of the Family FMT\_LIM

157 The family FMT\_LIM describes the functional requirements for the test features of the TOE. The new functional requirements were defined in the class FMT because this class addresses the management of functions of the TSF. The examples of the technical mechanism used in the TOE show that no other class is appropriate to address the specific issues of preventing abuse of functions by limiting the capabilities of the functions and by limiting their availability.

158 The family 'Limited capabilities and availability (FMT\_LIM)' is specified as follows:

### **FMT\_LIM Limited capabilities and availability**

### Family behaviour

This family defines requirements that limit the capabilities and availability of functions in a combined manner. Note, that FDP\_ACF restricts access to functions whereas the Limited capability of this family requires the functions themselves to be designed in a specific manner.

### Component levelling:

FMT\_LIM.1 Limited capabilities requires that the TSF is built to provide only the capabilities (perform action, gather information) necessary for its genuine purpose.

FMT\_LIM.2 Limited availability requires that the TSF restrict the use of functions (refer to Limited capabilities (FMT\_LIM.1)). This can be achieved, for instance, by removing or by disabling functions in a specific phase of the TOE's life-cycle.

Management: FMT\_LIM.1, FMT\_LIM.2

There are no management activities foreseen.

Audit: FMT\_LIM.1, FMT\_LIM.2

There are no actions defined to be auditable.

### **FMT\_LIM.1 Limited capabilities**

Hierarchical to: No other components

Dependencies: FMT\_LIM.2 Limited availability

FMT\_LIM.1.1 The TSF shall be designed in a manner that limits their capabilities so that in conjunction with 'Limited availability (FMT\_LIM.2)' the following policy is enforced [assignment: *Limited capability and availability policy*].

### **FMT\_LIM.2 Limited availability**

Hierarchical to: No other components

Dependencies: FMT\_LIM.1 Limited capabilities

FMT\_LIM.2.1 The TSF shall be designed in a manner that limits their availability so that in conjunction with 'Limited capabilities (FMT\_LIM.1)' the following policy is enforced [assignment: *Limited capability and availability policy*].

159 *Application note 47*: The functional requirements FMT\_LIM.1 and FMT\_LIM.2 assume existence of two types of mechanisms (limited capabilities and limited availability) which together shall provide protection in order to enforce the related policy. This also allows that

- (i) the TSF is provided without restrictions in the product in its user environment, but its capabilities are so limited that the policy is enforced

or conversely

- (ii) the TSF is designed with high functionality, but is removed or disabled in the product in its user environment.

The combination of both the requirements shall enforce the related policy.

## 5.5 Definition of the Family FPT\_EMSEC

160 The family FPT\_EMSEC (TOE Emanation) of the class FPT (Protection of the TSF) is defined here to describe the IT security functional requirements of the TOE. The TOE shall prevent attacks against secret data stored in and used by the TOE where the attack is based on external observable physical phenomena of the TOE. Examples of such attacks are evaluation of TOE's electromagnetic radiation, simple power analysis (SPA), differential power analysis (DPA), timing attacks, etc. This family describes the functional requirements for the limitation of intelligible emanations being not directly addressed by any other component of CC part 2 [2].

161 The family 'TOE Emanation (FPT\_EMSEC)' is specified as follows:

### **FPT\_EMSEC TOE emanation**

Family behaviour

This family defines requirements to mitigate intelligible emanations.

Component levelling:

FPT\_EMSEC TOE emanation

1

FPT\_EMSEC.1 TOE emanation has two constituents:

FPT\_EMSEC.1.1 Limit of Emissions requires to not emit intelligible emissions enabling access to TSF data or user data.

FPT\_EMSEC.1.2 Interface Emanation requires to not emit interface emanation enabling access to TSF data or user data.

Management: FPT\_EMSEC.1

There are no management activities foreseen.

Audit: FPT\_EMSEC.1

There are no actions defined to be auditable.

### **FPT\_EMSEC.1 TOE Emanation**

Hierarchical to: No other components

Dependencies: No dependencies

FPT\_EMSEC.1.1 The TOE shall not emit [assignment: *types of emissions*] in excess of [assignment: *specified limits*] enabling access to [assignment: *list of types of TSF data*] and [assignment: *list of types of user data*].

FPT\_EMSEC.1.2 The TSF shall ensure [assignment: *type of users*] are unable to use the following interface [assignment: *type of connection*] to gain access to [assignment: *list of types of TSF data*] and [assignment: *list of types of user data*].

## 6 Security Requirements

- 162 This part of the PP defines the detailed security requirements that shall be satisfied by the TOE. The statement of TOE security requirements shall define the *functional* and *assurance* security requirements that the TOE needs to satisfy in order to meet the security objectives for the TOE.
- 163 The CC allows several operations to be performed on security requirements (on the component level); *refinement*, *selection*, *assignment* and *iteration* are defined in sec. 8.1 of Part 1 [1] of the CC. Each of these operations is used in this PP.
- 164 The **refinement** operation is used to add detail to a requirement, and, thus, further restricts a requirement. Refinements of security requirements are denoted in such a way that added words are in **bold text** and removed words are ~~crossed out~~.
- 165 The **selection** operation is used to select one or more options provided by the CC in stating a requirement. Selections having been made by the PP author are denoted as underlined text. Selections to be filled in by the ST author appear in square brackets with an indication that a selection is to be made, [selection:], and are *italicised*.
- 166 The **assignment** operation is used to assign a specific value to an unspecified parameter, such as the length of a password. Assignments having been made by the PP author are denoted by showing as underlined text. Assignments to be filled in by the ST author appear in square brackets with an indication that an assignment is to be made [assignment:], and are *italicised*. In some cases the assignment made by the PP authors defines a selection to be performed by the ST author. Thus this text is underlined and italicised like *this*.
- 167 The **iteration** operation is used when a component is repeated with varying operations. Iteration is denoted by showing a slash “/”, and the iteration indicator after the component identifier. For the sake of a better readability, the iteration operation may also be applied to some single components (being not repeated) in order to indicate belonging of such SFRs to same functional cluster. In such a case, the iteration operation is applied to only one single component.
- 168 In order to distinguish between the SFRs taken over from the PPs, to which this PP is claimed to be conformant, and other SFRs having the same denotation, the author iterated these SFRs by  
- ‘/ICAO-EAC’ or ‘/XXX\_ICAO-EAC’ for the ICAO-EAC PP [6],  
- ‘/PACE-Pass’ or ‘/XXX\_PACE\_Pass’ for the PACE-Pass PP [7], and  
- ‘/SSCD’ or ‘/XXX\_SSCD’ for the SSCD PP [8].

### 6.1 Security Functional Requirements for the TOE

#### 6.1.1 Overview

- 169 In order to give an overview of the security functional requirements in the context of the security services offered by the TOE, the author of the PP defined the security functional groups and allocated the functional requirements described in the following sections to them:

Security Functional Groups	Security Functional Requirements concerned
Access control to the User Data stored in the TOE	– {FDP_ACC.1/TRM, FDP_ACF.1/TRM}

Security Functional Groups	Security Functional Requirements concerned
	<p>Supported by:</p> <ul style="list-style-type: none"> <li>– FIA_UAU.1/Rightful_Terminal: Terminal Authentication (BIS-PACE, EIS-GAP, ATT, SGT)</li> <li>– FIA_UAU.1/ICAO-EAC: Terminal Authentication (EIS-AIP-BAC)</li> <li>– {FDP_ACC.1/Signature-creation_SFP_SS CD, FDP_ACF.1/Signature-creation_SFP_SS CD}</li> </ul>
Secure data exchange between the RP_Card and the Service Provider connected	<ul style="list-style-type: none"> <li>– FTP_ITC.1/CA: trusted channel for EIS-AIP-BAC, EIS-GAP, ATT, SGT</li> <li>– FTP_ITC.1/PACE: trusted channel for BIS-PACE</li> </ul> <p>Supported by:</p> <p>a) for GAP:</p> <ul style="list-style-type: none"> <li>– FCS_COP.1/AES: encryption/decryption</li> <li>– FCS_COP.1/CMAC: MAC generation/verification</li> <li>– FIA_API.1/CA: Chip Identification/Authentication (version 2)</li> <li>– FIA_UAU.1/Rightful_Terminal: Terminal Authentication (BIS-PACE, EIS-GAP, ATT, SGT)</li> </ul> <p>b) for AIP:</p> <ul style="list-style-type: none"> <li>– FCS_COP.1/SYM_ICAO-EAC: encryption/decryption</li> <li>– FCS_COP.1/MAC_ICAO-EAC: MAC generation/verification</li> <li>– FIA_API.1/ICAO-EAC: Chip Identification/Authentication (version 1)</li> <li>– FIA_UAU.1/ICAO-EAC: Terminal Authentication (EIS-AIP-BAC)</li> </ul>
Identification and authentication of users and components	<ul style="list-style-type: none"> <li>– FIA_UID.1/PACE: PACE Identification (PCT equiv. BIS-PACE)</li> <li>– FIA_UID.1/Rightful_Terminal: Terminal Identification (EIS-GAP, ATT, SGT)</li> <li>– FIA_UID.1/ICAO-EAC: Terminal Identification (EIS-AIP-BAC)</li> <li>– FIA_UAU.1/PACE: PACE Authentication (PCT equiv. BIS-PACE)</li> <li>– FIA_UAU.1/Rightful_Terminal: Terminal Authentication (EIS-GAP, ATT, SGT)</li> <li>– FIA_API.1/CA: Chip Identification /</li> </ul>

Security Functional Groups	Security Functional Requirements concerned
	<p>Authentication for GAP (version 2)</p> <ul style="list-style-type: none"> <li>– FIA_UAU.1/ICAO-EAC: Terminal Authentication (EIS-AIP-BAC)</li> <li>– FIA_API.1/ICAO-EAC: Chip Identification/Authentication for AIP (version 1)</li> <li>– FIA_APO.1/PA_PACE-Pass: Passive Authentication using SO<sub>D</sub> (with previous FIA_UAU.1/PACE =&gt; BIS-PACE)</li> </ul> <p>– FIA_UAU.4: single-use of authentication data</p> <p>– FIA_UAU.5: multiple authentication mechanisms</p> <p>– FIA_UAU.6: Re-authentication of Terminal</p> <p>– FIA_AFL.1/eID-PIN_Suspending</p> <p>– FIA_AFL.1/eID-PIN_Blocking: reaction to unsuccessful authentication attempts for establishing PACE communication using <i>blocking</i> authentication data</p> <p>– FIA_AFL.1/PACE: reaction to unsuccessful authentication attempts for establishing PACE communication using <i>non-blocking</i> authentication and authorisation data</p> <p>– FIA_UID.1/SSCD: Identification of RP_Card holder as Signatory (eSign-PIN)</p> <p>– FIA_UIA.1/SSCD: Authentication of RP_Card holder as Signatory (eSign-PIN)</p> <p>– FIA_AFL.1/SSCD: Blocking of the Signatory's RAD (eSign-PIN)</p> <p>Supported by:</p> <ul style="list-style-type: none"> <li>– FCS_CKM.1/DH_PACE: PACE authentication (PCT)</li> <li>– FCS_COP.1/SIG_VER: Terminal Authentication (EIS-AIP-BAC, EIS-GAP, ATT, SGT)</li> <li>– FCS_CKM.1/DH_CA: Chip Authentication</li> <li>– FCS_CKM.2/DH: Diffie-Hellmann key distribution within PACE and Chip Authentication</li> <li>– FCS_CKM.4: session keys destruction (authentication expiration)</li> <li>– FCS_COP.1/SHA: Keys derivation</li> <li>– FCS_RND.1: random numbers generation</li> </ul> <p>– FTP_ITC.1/PACE: preventing tracing while</p>

Security Functional Groups	Security Functional Requirements concerned
	<p>establishing Chip Authentication</p> <p>– FMT_SMR.1: security roles definition.</p>
Audit	<p>– FAU_SAS.1 : Audit storage</p> <p>Supported by:</p> <p>– FMT_MTD.1/INI_ENA: Writing Initialisation and Pre-personalisation</p> <p>– FMT_MTD.1/INI_DIS: Disabling access to Initialisation and Pre-personalisation Data in the operational phase</p>
Generation of the Signature Key Pair for the eSign application	<p>– FCS_CKM.1/SSCD</p> <p>Supported by:</p> <p>– FCS_CKM.4/SSCD</p> <p>– {FDP_ACC.1/SCD/SVD_Generation_SFP_SSCD, FDP_ACF.1/SCD/SVD_Generation_SFP_SSCD}</p> <p>– {FDP_ACC.1/SVD_Transfer_SFP_SSCD, FDP_ACF.1/SVD_Transfer_SFP_SSCD}</p>
Creation of Electronic Signatures by the eSign application	– FCS_COP.1/SSCD
Management of and access to TSF and TSF-data	<p>– The entire class FMT.</p> <p>Supported by:</p> <p>– the entire class FIA: user identification / authentication</p>
Accuracy of the TOE security functionality / Self-protection	<p>– The entire class FPT</p> <p>– FDP_RIP.1: enforced memory/storage cleaning</p> <p>– FDP_SDI.2/Persistent_SSCD</p> <p>– FDP_SDI.2/DTBS_SSCD</p> <p>Supported by:</p> <p>– the entire class FMT.</p>

**Table 21: Security functional groups vs. SFRs**

170 The following table provides an overview of the keys and certificates used for enforcing the security policy defined in the current PP:

Name	Data
<b>Receiving PKI branch</b>	
Country Verifying Certification Authority Private Key (SK <sub>CVCA</sub> )	The Country Verifying Certification Authority (CVCA) holds a private key (SK <sub>CVCA</sub> ) used for signing the Document Verifier Certificates.

Name	Data
Country Verifying Certification Authority Public Key (PK <sub>CVCA</sub> )	The TOE stores the Country Verifying Certification Authority Public Key (PK <sub>CVCA</sub> ) as part of the TSF-data to verify the Document Verifier Certificates.
Country Verifying Certification Authority Certificate (C <sub>CVCA</sub> )	The Country Verifying Certification Authority Certificate may be a self-signed certificate or a link certificate (cf. [12] and Glossary). It contains (i) the Country Verifying Certification Authority Public Key (PK <sub>CVCA</sub> ) as authentication reference data, (ii) the coded access control rights of the Country Verifying Certification Authority, (iii) the Certificate Effective Date and the Certificate Expiration Date as security attributes.
Document Verifier Certificate (C <sub>DV</sub> )	The Document Verifier Certificate C <sub>DV</sub> is issued by the Country Verifying Certification Authority. It contains (i) the Document Verifier Public Key (PK <sub>DV</sub> ) as authentication reference data (ii) an identification as domestic or foreign Document Verifier, the coded access control rights of the Document Verifier, the Certificate Effective Date and the Certificate Expiration Date as security attributes.
Terminal Certificate (C <sub>T</sub> )	The Terminal Certificate (C <sub>T</sub> ) is issued by the Document Verifier. It contains (i) the Terminal Public Key (PK <sub>PCD</sub> ) as authentication reference data, (ii) the coded access control rights of the terminal (EIS-AIP-BAC, EIS-GAP, ATT, SGT), the Certificate Effective Date and the Certificate Expiration Date as security attributes.
<b>Issuing PKI branch</b>	
Country Signing Certification Authority Key Pair and Certificate	Country Signing Certification Authority of the RP_Card Issuer signs the Document Signer Public Key Certificate (C <sub>DS</sub> ) with the Country Signing Certification Authority Private Key (SK <sub>CSCA</sub> ) and the signature will be verified by receiving terminal with the Country Signing Certification Authority Public Key (PK <sub>CSCA</sub> ). The CSCA also issues the self-signed CSCA Certificate (C <sub>CSCA</sub> ) having to be distributed by strictly secure diplomatic means, see. [9], 5.1.1.
Document Signer Key Pairs and Certificates	The Document Signer Certificate C <sub>DS</sub> is issued by the Country Signing Certification Authority. It contains the Document Signer Public Key (PK <sub>DS</sub> ) as authentication reference data. The Document Signer acting under the policy of the CSCA signs the Card/Chip Security Object (SO <sub>C</sub> ) of the RP_Card and the Document Security Object (SO <sub>D</sub> ) of the ePassport application with the Document Signer Private Key (SK <sub>DS</sub> ) and the signature will be verified by a terminal as the Passive Authentication with the Document Signer Public Key (PK <sub>DS</sub> ).
Chip Authentication Public Key (PK <sub>PICC</sub> )	PK <sub>PICC</sub> is stored in an EF on the RP_Card and used by the terminal for the Chip Authentication. Its authenticity is verified by the terminal in the context of the Passive Authentication (verification of SO <sub>C</sub> ).
Chip Authentication Private Key (SK <sub>PICC</sub> )	The static Chip Authentication Key Pair {SK <sub>PICC</sub> , PK <sub>PICC</sub> } is used for Key Agreement Protocol: Diffie-Hellman (DH) according to PKCS#3 or Elliptic Curve Diffie-Hellman (ECDH; ECKA key agreement algorithm) according to TR-03111 [14], cf. [12], table. A.2.  SK <sub>PICC</sub> is used by the TOE to authenticate itself as authentic

Name	Data
	RP_Card.
<b>Session keys</b>	
PACE Session Keys (PACE- $K_{MAC}$ , PACE- $K_{Enc}$ )	Secure messaging AES keys for message authentication (CMAC-mode) and for message encryption (CBC-mode) agreed between the TOE and a terminal (PCT <sup>101</sup> ) as result of the PACE Protocol, see [12], sec. A.3, F.2.2, A.2.3.2.
Chip Authentication Session Keys (CA- $K_{MAC}$ , CA- $K_{Enc}$ )	Secure messaging AES keys for message authentication (CMAC-mode) and for message encryption (CBC-mode) agreed between the TOE and a terminal (EIS-AIP-BAC, EIS-GAP, ATT, SGT) as result of the Chip Authentication Protocol, see [12], sec. A.4, F.2.2, A.2.3.2.
<b>Ephemeral keys</b>	
PACE authentication ephemeral key pair (ephem-SK <sub>PICC-PACE</sub> , ephem-PK <sub>PICC-PACE</sub> )	The ephemeral PACE Authentication Key Pair {ephem-SK <sub>PICC-PACE</sub> , ephem-PK <sub>PICC-PACE</sub> } is used for Key Agreement Protocol: Diffie-Hellman (DH) according to PKCS#3 or Elliptic Curve Diffie-Hellman (ECDH; ECKA key agreement algorithm) according to TR-03111 [14], cf. [12], table. A.2.
<b>Restricted Identification keys</b>	
Restricted Identification Key Pair {SK <sub>ID</sub> , PK <sub>ID</sub> }	<p>Static Diffie-Hellman key pair, whereby the related private key SK<sub>ID</sub> is stored in the TOE and used for generation of the sector-specific chip-identifier <math>I_{ID}^{Sector}</math> (pseudo-anonymisation), see [12], sec. 4.1.3.1 and Table 4.1, 4.5.1.</p> <p>This key represents user data within the current security policy, cf. Table 2, object #1.</p> <p>The belonging public key PK<sub>ID</sub> is used for a revocation request and should not be stored in the TOE, see [12], sec. 4.1.3.1 and Table 4.1, 4.5.3.</p> <p>For Restricted Identification please also refer to the <i>Application note 6</i>.</p>
<b>Signature keys</b>	
Signature Creation Key Pair {SCD, SVD}	<p>Signature Creation Data (SCD) is represented by a private cryptographic key being used by the RP_Card holder (signatory) to create an electronic signature. This key represents user data (Table 2, object #1).</p> <p>Signature Verification Data (SVD) is represented by a public cryptographic key corresponding with SCD and being used for the purpose of verifying an electronic signature.</p> <p>Properties of this key pair shall fulfil the relevant requirements stated in [17].</p>

**Table 22: Keys and Certificates**

<sup>101</sup> From the point of view of the terminal's rights, there is no difference between PCT and BIS-PACE, cf. glossary

## 6.1.2 Class FCS Cryptographic Support

### 6.1.2.1 Cryptographic key generation (FCS\_CKM.1)

#### 171 FCS\_CKM.1/DH\_PACE Cryptographic key generation – Diffie-Hellman for PACE session keys

Hierarchical to:	No other components.
Dependencies:	[FCS_CKM.2 Cryptographic key distribution or FCS_COP.1 Cryptographic operation]: fulfilled by FCS_CKM.2/DH. FCS_CKM.4 Cryptographic key destruction: fulfilled by FCS_CKM.4
FCS_CKM.1.1	The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [selection: <i>Diffie-Hellman-Protocol compliant to PKCS#3, ECDH compliant to [14]</i> ] <sup>102</sup> and specified cryptographic key sizes [assignment: <i>cryptographic key sizes</i> ] that meet the following: [12], Appendix A.3 <sup>103</sup> .

This item concerns the following application(s): ePassport, eID, eSign.

172 *Application note 48:* The TOE generates a shared secret value  $K$  with the terminal during the PACE protocol, see [12], sec. 4.2 and A.3. This protocol may be based on the Diffie-Hellman-Protocol compliant to PKCS#3 (i.e. modulo arithmetic based cryptographic algorithm, cf. [19]) or on the ECDH compliant to TR-03111 [14] (i.e. the elliptic curve cryptographic algorithm ECKA, cf. [12], Appendix A.3 and [14] for details). The shared secret value  $K$  is used for deriving the AES session keys for message encryption and message authentication (PACE- $K_{MAC}$ , PACE- $K_{Enc}$ ) according to [12], F.2.2 and A.2.3.2 for the TSF required by FCS\_COP.1/AES and FCS\_COP.1/CMAC.

#### 173 FCS\_CKM.1/DH\_CA Cryptographic key generation – Diffie-Hellman for Chip Authentication session keys

Hierarchical to:	No other components.
Dependencies:	[FCS_CKM.2 Cryptographic key distribution or FCS_COP.1 Cryptographic operation]: fulfilled by FCS_CKM.2/DH. FCS_CKM.4 Cryptographic key destruction: fulfilled by FCS_CKM.4
FCS_CKM.1.1	The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [selection: <i>Diffie-Hellman-Protocol compliant to PKCS#3, ECDH compliant to [14]</i> ] <sup>104</sup> and specified cryptographic key sizes [assignment: <i>cryptographic key sizes</i> ]

---

<sup>102</sup> [assignment: *cryptographic key generation algorithm*]

<sup>103</sup> [assignment: *list of standards*]

<sup>104</sup> [assignment: *cryptographic key generation algorithm*]

that meet the following: [12], Annex A.4<sup>105</sup>.

This item concerns the following application(s): ePassport, eID, eSign.

- 174 *Application note 49:* The TOE generates a shared secret value with the terminal during the CA Protocol, see [12], sec. 4.3 and A.4. This protocol may be based on the Diffie-Hellman-Protocol compliant to PKCS#3 (i.e. modulo arithmetic based cryptographic algorithm, cf. [19]) or on the ECDH compliant to TR-03111 [14] (i.e. an elliptic curve cryptography algorithm, cf. [12], Appendix A.4 and [14] for details). The shared secret value is used to derive the AES session keys for message encryption and message authentication (CA-K<sub>MAC</sub>, CA-K<sub>Enc</sub>) according to the [12], F.2.2 and A.2.3.2 for the TSF required by FCS\_COP.1/AES and FCS\_COP.1/CMAC.

175 **FCS\_CKM.2/DH** **Cryptographic key distribution – Diffie-Hellman**

Hierarchical to: No other components.

Dependencies: [FDP\_ITC.1 or FDP\_ITC.2 or FCS\_CKM.1]: fulfilled by  
FCS\_CKM.1/DH\_PACE, FCS\_CKM.1/DH\_CA  
FCS\_CKM.4: fulfilled by FCS\_CKM.4

FCS\_CKM.2.1 The TSF shall distribute cryptographic keys in accordance with a specified cryptographic key distribution method as specified in the list below<sup>106</sup> that meets the following:

- a) PACE: as specified in [12], sec. 4.2 and A.3;
- b) CA: as specified in [12], sec. 4.3 (version 2 (for GAP)) and A.4<sup>107</sup>.

This item concerns the following application(s): ePassport, eID, eSign.

176 **FCS\_CKM.4** **Cryptographic key destruction – Session keys**

Hierarchical to: No other components.

Dependencies: [FDP\_ITC.1 Import of user data without security attributes, or  
FDP\_ITC.2 Import of user data with security attributes, or  
FCS\_CKM.1 Cryptographic key generation]: fulfilled by  
FCS\_CKM.1/DH\_PACE, FCS\_CKM.1/DH\_CA

FCS\_CKM.4.1 The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method [*assignment: cryptographic key destruction method*] that meets the following: [*assignment: list of standards*].

This item concerns the following application(s): ePassport, eID, eSign.

---

<sup>105</sup> [assignment: *list of standards*]

<sup>106</sup> [assignment: *cryptographic key distribution method*]

<sup>107</sup> [assignment: *list of standards*]

177 *Application note 50*: The TOE shall destroy the PACE session keys (i) after detection of an error in a received command by verification of the MAC, and (ii) after successful run of the Chip Authentication Protocol. The TOE shall destroy the CA session keys after detection of an error in a received command by verification of the MAC. The TOE shall clear the memory area of any session keys before starting the communication with the terminal in a new after-reset-session as required by FDP\_RIP.1.

### 6.1.2.2 Cryptographic operation (FCS\_COP.1)

#### 178 FCS\_COP.1/SHA Cryptographic operation – Hash for key derivation

Hierarchical to:	No other components.
Dependencies:	[FDP_ITC.1 Import of user data without security attributes, or FDP_ITC.2 Import of user data with security attributes, or FCS_CKM.1 Cryptographic key generation]: not fulfilled, but <b>justified</b>  A hash function does not use any cryptographic key; hence, neither a respective key import nor key generation can be expected here.  FCS_CKM.4 Cryptographic key destruction: not fulfilled, but <b>justified</b>  A hash function does not use any cryptographic key; hence, a respective key destruction cannot be expected here.
FCS_COP.1.1	The TSF shall perform <u>hashing</u> <sup>108</sup> in accordance with a specified cryptographic algorithm [assignment: <i>cryptographic algorithm</i> ] and cryptographic key sizes <u>none</u> <sup>109</sup> that meet the following: <u>FIPS 180-2 [21]</u> <sup>110</sup> .

This item concerns the following application(s): ePassport, eID, eSign.

179 *Application note 51*: For compressing (hashing) an ephemeral public key for DH (PACE<sup>111</sup> and CA<sup>112</sup>), the hash function SHA-1 shall be used ([12], table A.2).  
The TOE shall implement hash functions either SHA-1 or SHA-224 or SHA-256 for the Terminal Authentication Protocol (cf. [12], tables A.13 and A.14).  
Within the normative Appendix A of [12], section A.2.3 ‘Key Derivation Function’, [12] states that the hash function SHA-1 shall be used for deriving 128-bit AES keys, whereas SHA-256 – for deriving 192-bit and 256-bit AES keys.

#### 180 FCS\_COP.1/SIG\_VER Cryptographic operation – Signature verification

<sup>108</sup> [assignment: *list of cryptographic operations*]

<sup>109</sup> [assignment: *cryptographic key sizes*]

<sup>110</sup> [assignment: *list of standards*]

<sup>111</sup> ID<sub>PICC</sub> ≡ Comp(ephem-PK<sub>PICC</sub>-PACE) in [12], sec. 4.4; the public key compression function is defined in table A.2 of [12].

<sup>112</sup> Comp(ephem-PK<sub>PICD</sub>-TA) in [12], sec. 4.3.1 (version 1 for AIP, version 2 for GAP); the public key compression function is defined in table A.2 of [12].

Hierarchical to:	No other components.
Dependencies:	[FDP_ITC.1 Import of user data without security attributes, or FDP_ITC.2 Import of user data with security attributes, or FCS_CKM.1 Cryptographic key generation]: not fulfilled, but <b>justified</b>  The root key PK <sub>CVCA</sub> used for verifying C <sub>DV</sub> is stored in the TOE during its personalisation (in the card issuing life cycle phase) <sup>113</sup> . Since importing the respective certificates (C <sub>T</sub> , C <sub>DV</sub> ) does not require any special security measures except those required by the current SFR (cf. FMT_MTD.3 below), the current PP does not contain any dedicated requirement like FDP_ITC.2 for the import function.  FCS_CKM.4 Cryptographic key destruction: not fulfilled, but <b>justified</b>  Cryptographic keys used for the purpose of the current SFR (PK <sub>PCD</sub> , PK <sub>DV</sub> , PK <sub>CVCA</sub> ) are public keys; they do not represent any secret and, hence, needn't to be destroyed.
FCS_COP.1.1	The TSF shall perform <u>digital signature verification</u> <sup>114</sup> in accordance with a specified cryptographic algorithm [assignment: <i>cryptographic algorithm</i> ] and cryptographic key sizes [assignment: <i>cryptographic key sizes</i> ] that meet the following: [assignment: <i>list of standards</i> ].

This item concerns the following application(s): ePassport, eID, eSign.

181 *Application note 52*: The ST writer shall perform the missing operation of the assignments for the signature algorithms key lengths and standards implemented by the TOE for the Terminal Authentication Protocol (cf. [12], Appendix A.6.3, A.6.4 and D.3 for details). The signature verification is used to verify the card verifiable certificates and the authentication attempt of the terminal generated a digital signature for the TOE challenge, see [12], sec. 4.4. The related static public keys (PK<sub>PCD</sub>, PK<sub>DV</sub>) are imported within the respective certificates (C<sub>T</sub>, C<sub>DV</sub>) during the TA and are extracted by the TOE using PK<sub>CVCA</sub> as the root key stored in the TOE during its personalisation (see P.Terminal\_PKI).

## 182 FCS\_COP.1/AES                      Cryptographic operation – Encryption / Decryption AES

Hierarchical to:	No other components.
Dependencies:	[FDP_ITC.1 Import of user data without security attributes, or FDP_ITC.2 Import of user data with security attributes, or FCS_CKM.1 Cryptographic key generation]: fulfilled by FCS_CKM.1/DH_PACE, FCS_CKM.1/DH_CA  FCS_CKM.4 Cryptographic key destruction: fulfilled by FCS_CKM.4.

<sup>113</sup> as already mentioned, operational use of the TOE is explicitly in focus of the current PP

<sup>114</sup> [assignment: *list of cryptographic operations*]

FCS\_COP.1.1 The TSF shall perform secure messaging – encryption and decryption<sup>115</sup> in accordance with a specified cryptographic algorithm AES in CBC mode<sup>116</sup> and cryptographic key sizes [selection: 128, 192, 256] bit<sup>117</sup> that meet the following: FIPS 197 [18] and [12] Appendix F.2.2<sup>118</sup>.

This item concerns the following application(s): ePassport, eID, eSign.

183 *Application note 53*: This SFR requires the TOE to implement the cryptographic primitive AES for secure messaging with encryption of transmitted data. The related session keys are agreed between the TOE and the terminal as part of either the PACE protocol according to the FCS\_CKM.1/DH\_PACE (PACE- $K_{Enc}$ ) or the Chip Authentication Protocol according to the FCS\_CKM.1/DH\_CA (CA- $K_{Enc}$ ). Note that in accordance with [12] Appendix F.2.1 and A.2.3.1 the (two-key) Triple-DES could be used in CBC mode for secure messaging. It is also a valid option in the ICAO-EAC PP [6] (see FCS\_COP.1/SYM there). Due to the fact that the (two-key) Triple-DES is not recommended any more (cf. [13], sec. 1.3), Triple-DES is applicable only to using EIS-AIP-BAC for reason of compliance with [6] and is also covered by [6]. For all other terminal types being in the scope of the current PP, Triple-DES in any mode is no longer applicable within this PP.

#### 184 FCS\_COP.1/CMAC

#### Cryptographic operation – CMAC

Hierarchical to: No other components.

Dependencies: [FDP\_ITC.1 Import of user data without security attributes, or FDP\_ITC.2 Import of user data with security attributes, or FCS\_CKM.1 Cryptographic key generation]: fulfilled by FCS\_CKM.1/DH\_PACE, FCS\_CKM.1/DH\_CA  
FCS\_CKM.4 Cryptographic key destruction: fulfilled by FCS\_CKM.4.

FCS\_COP.1.1 The TSF shall perform secure messaging – message authentication code<sup>119</sup> in accordance with a specified cryptographic algorithm CMAC<sup>120</sup> and cryptographic key sizes [selection: 128, 192, 256] bit<sup>121</sup> that meet the following: 'The CMAC Mode for Authentication, NIST Special Publication 800-38B' [20] and [12] Appendix F.2.2<sup>122</sup>.

This item concerns the following application(s): ePassport, eID, eSign.

---

<sup>115</sup> [assignment: *list of cryptographic operations*]

<sup>116</sup> [assignment: *cryptographic algorithm*]

<sup>117</sup> [assignment: *cryptographic key sizes*]

<sup>118</sup> [assignment: *list of standards*]

<sup>119</sup> [assignment: *list of cryptographic operations*]

<sup>120</sup> [assignment: *cryptographic algorithm*]

<sup>121</sup> [assignment: *cryptographic key sizes*]

<sup>122</sup> [assignment: *list of standards*]

185 *Application note 54*: This SFR requires the TOE to implement the cryptographic primitive for secure messaging with message authentication code over transmitted data. The related session keys are agreed between the TOE and the terminal as part of either the PACE protocol according to the FCS\_CKM.1/DH\_PACE (PACE- $K_{MAC}$ ) or the Chip Authentication Protocol according to the FCS\_CKM.1/DH\_CA (CA- $K_{MAC}$ ). Note that in accordance with [12] Appendix F.2.1 and A.2.3.1 the (two-key) Triple-DES could be used in Retail mode for secure messaging. It is also a valid option in the ICAO-EAC PP [6] (see FCS\_COP.1/MAC there). Due to the fact that the (two-key) Triple-DES is not recommended any more (cf. [13], sec. 1.3), Triple-DES is applicable only to using EIS-AIP-BAC for reason of compliance with [6] and is also covered by [6]. For all other terminal types being in the scope of the current PP, Triple-DES in any mode is no longer applicable within this PP.

### 6.1.2.3 Random Number Generation (FCS\_RND.1)

#### 186 FCS\_RND.1 Quality metric for random numbers

Hierarchical to:	No other components.
Dependencies:	No dependencies.
FCS_RND.1.1	The TSF shall provide a mechanism to generate random numbers that meet [assignment: <i>a defined quality metric</i> ].

This item concerns the following application(s): ePassport, eID, eSign.

187 *Application note 55*: This SFR requires the TOE to generate random numbers (random nonce) used for the authentication protocols (PACE, CA and TA) as required by FIA\_UAU.4.

188 The current PP also includes all SFRs of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application. For the functional class FCS, there are the following components:

SFR identifier from [6]	Equivalent to / covered by item in the current PP	Comments
FCS_CKM.1/ICAO-EAC	FCS_CKM.1/DH_CA	-
FCS_CKM.4/ICAO-EAC	FCS_CKM.4	-
FCS_COP.1/SHA_ICAO-EAC	FCS_COP.1/SHA	-
FCS_COP.1/SYM_ICAO-EAC	FCS_COP.1/AES (partially)	FCS_COP.1/AES covers only AES.  Additionally, FCS_COP.1/SYM allows Triple-DES.

SFR identifier from [6]	Equivalent to / covered by item in the current PP	Comments
FCS_COP.1/MAC_IC AO-EAC	FCS_COP.1/MAC (partially)	FCS_COP.1/MAC covers only AES.  Additionally, FCS_COP.1/SYM allows Triple-DES.
FCS_COP.1/SIG_VER _ICAO-EAC	FCS_COP.1/SIG_VER	-
FCS_RND.1/ICAO- EAC	FCS_RND.1	-

189 The current PP also includes all SFRs of the PACE-Pass PP [7]. Formally, they only concern the *ePassport* application. For the functional class FCS, there are the following components:

SFR identifier from [7]	Equivalent to / covered by item in the current PP	Comments
FCS_CKM.1/DH_PAC E_PACE-Pass	FCS_CKM.1/DH_PACE	-
FCS_CKM.2/DH_PAC E-Pass	FCS_CKM.2/DH	-
FCS_CKM.4/PACE- Pass	FCS_CKM.4	-
FCS_COP.1/AES_PA CE-Pass	FCS_COP.1/AES	-
FCS_COP.1/MAC_PA CE-Pass	FCS_COP.1/MAC	-
FCS_RND.1/PACE- Pass	FCS_RND.1	-

190 The current PP also includes all SFRs of the SSCD PP [8]. These items are applicable, if the *eSign* application is operational. Formally, they only concern the *eSign* application. For the functional class FCS, there are the following components:

SFR identifier from [8]	Equivalent to / covered by item in the current PP	Comments
-------------------------	---	----------

SFR identifier from [8]	Equivalent to / covered by item in the current PP	Comments
FCS_CKM.1/SSCD	-	-
FCS_CKM.4/SSCD	-	-
FCS_COP.1/SSCD	-	-

### 6.1.3 Class FIA Identification and Authentication

191 For the sake of better readability, Table 23 provides an overview of the authentication mechanisms used:

Name	SFR for the TOE	Comments
PACE protocol	FIA_UAU.1/PACE FIA_UAU.5 FIA_AFL.1/eID-PIN_Suspending FIA_AFL.1/eID-PIN_Blocking FIA_AFL.1/PACE	as required by FCS_CKM.1/DH_PACE
Terminal Authentication Protocol version 2 (for GAP)	FIA_UAU.1/Rightful_Terminal FIA_UAU.5	as required by FCS_COP.1/SIG_VER
Chip Authentication Protocol version 2 (for GAP)	FIA_API.1/CA, FIA_UAU.5, FIA_UAU.6	as required by FCS_CKM.1/DH_CA
Terminal Authentication Protocol version 1 (for AIP)	FIA_UAU.1/ICAO-EAC FIA_UAU.5/ICAO-EAC	inherited from [6]
Chip Authentication Protocol version 1 (for AIP)	FIA_API.1/ICAO-EAC, FIA_UAU.5/ICAO-EAC, FIA_UAU.6/ICAO-EAC	inherited from [6]
Passive Authentication using SO <sub>D</sub>	FIA_APO.1/PA_PACE-Pass	inherited from [7]
eSign-PIN	FIA_UAU.1/SSCD	inherited from [8]

**Table 23: Overview of authentication SFRs**

#### 192 FIA\_AFL.1/eID-PIN\_Suspending Authentication failure handling – Suspending eID-PIN

Hierarchical to:	No other components.
Dependencies:	FIA_UAU.1 Timing of authentication: fulfilled by FIA_UAU.1/PACE
FIA_AFL.1.1	The TSF shall detect when [selection: <i>[assignment: positive integer number]</i> , an administrator configurable positive integer within <i>[assignment: range of acceptable values]</i> ] unsuccessful authentication attempts occur related to <u>consecutive failed authentication attempts using</u>

	<u>eID-PIN as the shared password for PACE<sup>123</sup>.</u>
FIA_AFL.1.2	When the defined number of unsuccessful authentication attempts has been <u>met<sup>124</sup></u> , the TSF shall <u>suspend the reference value of eID-PIN according to [12], sec. 3.3.2<sup>125</sup></u> .

This item concerns the following application(s): eID, eSign.

#### 193 FIA\_AFL.1/eID-PIN\_Blocking Authentication failure handling – Blocking eID-PIN

Hierarchical to:	No other components.
Dependencies:	FIA_UAU.1 Timing of authentication: fulfilled by FIA_UAU.1/PACE
FIA_AFL.1.1	The TSF shall detect when [selection: <i>[assignment: positive integer number], an administrator configurable positive integer within [assignment: range of acceptable values]</i> ] unsuccessful authentication attempts occur related to <u>consecutive failed authentication attempts using suspended<sup>126</sup> eID-PIN as the shared password for PACE<sup>127</sup></u> .
FIA_AFL.1.2	When the defined number of unsuccessful authentication attempts has been <u>met<sup>128</sup></u> , the TSF shall <u>block the reference value of eID-PIN according to [12], sec. 3.3.2<sup>129</sup></u> .

This item concerns the following application(s): eID, eSign.

- 194 *Application note 56:* According to [12], sec. 3.3.2, a *suspending* current value of the retry counter for eID-PIN shall be RC = 1, the *blocking* current value of the retry counter for eID-PIN shall be RC = 0; no initial value of RC is defined in [12]. The assignment shall be consistent with the implemented authentication mechanism and resistant against attacks with high attack potential.

#### 195 FIA\_AFL.1/PACE Authentication failure handling – PACE authentication using non-blocking authentication / authorisation data

Hierarchical to:	No other components.
Dependencies:	FIA_UAU.1 Timing of authentication: fulfilled by FIA_UAU.1/PACE
FIA_AFL.1.1	The TSF shall detect when <u>1<sup>130</sup> unsuccessful authentication attempts occurs related to authentication attempts using CAN, MRZ, eID-PUK as shared passwords for PACE<sup>131</sup></u> .

---

<sup>123</sup> [assignment: *list of authentication events*]

<sup>124</sup> [selection: *met, surpassed*]

<sup>125</sup> [assignment: *list of actions*]

<sup>126</sup> as required by FIA\_AFL.1/eID-PIN\_Suspending

<sup>127</sup> [assignment: *list of authentication events*]

<sup>128</sup> [selection: *met, surpassed*]

<sup>129</sup> [assignment: *list of actions*]

FIA\_AFL.1.2                      When the defined number of unsuccessful authentication attempts has been met<sup>132</sup>, the TSF shall [assignment: *list of actions*].

This item concerns the following application(s): ePassport, eID, eSign.

196 *Application Note 57*: The open assignment operation shall be performed according to a concrete implementation of the TOE, whereby actions to be executed by the TOE may either be common for all data concerned (CAN, MRZ, eID-PUK) or for an arbitrary subset of them or may also separately be defined for each datum in question.

Since all non-blocking authorisation and authentication data (CAN, MRZ and eID-PUK) being used as a shared secret within the PACE protocol do not possess a sufficient entropy<sup>133</sup>, the TOE shall not allow a quick monitoring of its behaviour (e.g. due to a long reaction time) in order to make the first step of the skimming attack<sup>134</sup> requiring an attack potential beyond high, so that the threat T.Tracing<sup>135</sup> can be averted in the frame of the security policy of the current PP.

One of some opportunities for performing this operation might be ‘*consecutively increase the reaction time of the TOE to the next authentication attempt using CAN, MRZ, eID-PUK*’.

197 *Application Note 58*: Please note that since guessing CAN, MRZ and eID-PUK requires an attack potential beyond high according to the current PP, monitoring the static PK<sub>PICC</sub> and SO<sub>C</sub> in the context of the chip authentication will also fail (due to FTP\_ITC.1/PACE), so that it is not essential, whether PK<sub>PICC</sub> and SO<sub>C</sub> ‘card-generation / batch’ or ‘card-individual’ data are.

#### 198 FIA\_API.1/CA                      Authentication Proof of Identity

Hierarchical to:              No other components.

Dependencies:                No dependencies.

FIA\_API.1.1                      The TSF shall provide the Chip Authentication Protocol according to [12], sec. 4.3, version 2 (for GAP)<sup>136</sup> to prove the identity of the TOE<sup>137</sup>.

This item concerns the following application(s): ePassport, eID, eSign.

199 *Application note 59*: The Chip Authentication shall be triggered by a rightful terminal immediately after the successful Terminal Authentication (as required

---

<sup>130</sup> [selection: *[assignment: positive integer number]*, an administrator configurable positive integer within *[assignment: range of acceptable values]*]

<sup>131</sup> [assignment: *list of authentication events*]

<sup>132</sup> [selection: *met, surpassed*]

<sup>133</sup>  $\geq 100$  bits; a theoretical maximum of entropy which can be delivered by a character string is  $N \cdot \text{ld}(C)$ , whereby N is the length of the string, C – the number of different characters which can be used within the string.

<sup>134</sup> guessing CAN or MRZ or eID-PUK, see T.Skimming above

<sup>135</sup> Please note that this threat is considered not to be allied with using EIS-AIP-BAC

<sup>136</sup> [assignment: *authentication mechanism*]

<sup>137</sup> [assignment: *authorised user or role*]

FIA\_UAU.1/Rightful\_Terminal) using, amongst other, Comp(ephem-PK<sub>PCD</sub>-TA)<sup>138</sup> from the accomplished TA. The terminal verifies genuineness of the RP\_Card by verifying the authentication token T<sub>PICC</sub> calculated by the RP\_Card using ephem-PK<sub>PCD</sub>-TA and CA-K<sub>MAC</sub>, (and, hence, finally making evident possessing the Chip Authentication Key (SK<sub>PICC</sub>)).

The Passive Authentication making evident authenticity of the PK<sub>PICC</sub> by verifying the Card/Chip Security Object (SO<sub>C</sub>) up to CSCA shall be triggered by the rightful terminal immediately after the successful Terminal Authentication before the Chip Authentication<sup>139</sup> and is considered to be part of the CA protocol within this PP (see also P.Terminal).

Please note that this SFR does not require authentication of any TOE's user, but providing evidence enabling an external entity (the terminal connected) to prove the TOE's identity.

If the Chip Authentication was successfully performed, Secure Messaging is restarted using the derived session keys (CA-K<sub>MAC</sub>, CA-K<sub>Enc</sub>), cf. FTP\_ITC.1/CA. Otherwise, Secure Messaging is continued using the previously established session keys (PACE-K<sub>MAC</sub>, PACE-K<sub>Enc</sub>), cf. FTP\_ITC.1/PACE.

Please note that the Chip Authentication Protocol according to [12], sec. 4.3, version 1 (for AIP) is covered by [6] (see FIA\_API.1 there).

## 200 FIA\_UID.1/PACE

### Timing of identification

Hierarchical to:	No other components.
Dependencies:	No dependencies.
FIA_UID.1.1	The TSF shall allow <ol style="list-style-type: none"> <li><u>establishing a communication channel</u>.</li> <li><u>carrying out the PACE Protocol according to [12], sec. 4.2</u><sup>140</sup> on behalf of the user to be performed before the user is identified.</li> </ol>
FIA_UID.1.2	The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.

This item concerns the following application(s): ePassport, eID, eSign.

201 *Application note 60*: User identified after a successfully performed PACE protocol is a PACE terminal (PCT). In case eID-PIN or eID-PUK were used for PACE, it is the RP\_Card holder using PCT. Please note that neither CAN nor MRZ effectively represent secrets, but are restricted-revealable; i.e. in case CAN or MRZ were used for PACE, it is either the RP\_Card holder itself or an authorised other person or device.

## 202 FIA\_UID.1/Rightful\_Terminal Timing of identification

<sup>138</sup> Comp() is public key compression function. It is defined in [12], table A.2 as SHA-1 (for Diffie-Hellmann)

<sup>139</sup> cf. [12], sec. 3.4

<sup>140</sup> [assignment: *list of TSF-mediated actions*]

Hierarchical to:	No other components.
Dependencies:	No dependencies.
FIA_UID.1.1	The TSF shall allow <ol style="list-style-type: none"><li>1. <u>establishing a communication channel</u>,</li><li>2. <u>carrying out the PACE protocol according to [12], sec. 4.2,</u></li><li>3. <u>carrying out the Terminal Authentication Protocol according to [12], sec. 4.4, version 2 (for GAP)</u><sup>141</sup></li></ol> on behalf of the user to be performed before the user is identified.
FIA_UID.1.2	The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.

This item concerns the following application(s): ePassport, eID, eSign.

203 *Application note 61:* The user identified after a successfully performed TA protocol is a rightful terminal, i.e. for GAP: either EIS-GAP or ATT or SGT.  
Please note that the Terminal Authentication Protocol according to [12], sec. 4.4, version 1 (for AIP) is covered by [6] (see FIA\_UID.1 there). In this case, the user identified after a successfully performed TA protocol is also a rightful terminal, namely EIS-AIP-BAC.

204 *Application note 62:* In the life cycle phase 'Manufacturing' the Manufacturer is the only user role known to the TOE. The Manufacturer writes the Initialisation Data and/or Pre-personalisation Data in the audit records of the IC.  
Please note that a Personalisation Agent acts on behalf of the RP\_Card Issuer under his and CSCA and DS policies. Hence, they define authentication procedure(s) for Personalisation Agents. The TOE must functionally support these authentication procedures being subject to evaluation within the assurance components ALC\_DEL.1 and AGD\_PRE.1. The TOE assumes the user role 'Personalisation Agent', when a terminal (e.g. ATT) proves the respective Terminal Authorisation Level like e.g. a 'privileged terminal', cf. [12], sec. C.4.3, Table C.4.

## 205 FIA\_UAU.1/PACE

### Timing of authentication

Hierarchical to:	No other components.
Dependencies:	FIA_UID.1 Timing of identification: fulfilled by FIA_UID.1/PACE
FIA_UAU.1.1	The TSF shall allow <ol style="list-style-type: none"><li>1. <u>establishing a communication channel</u>,</li><li>2. <u>carrying out the PACE Protocol according to [12], sec. 4.2</u><sup>142,143</sup></li></ol> on behalf of the user to be performed before the user is authenticated.

<sup>141</sup> [assignment: *list of TSF-mediated actions*]

<sup>142</sup> RP\_Card identifies itself within the PACE protocol by selection of the authentication key ephem-PK<sub>PICC-PACE</sub>

FIA\_UAU.1.2      The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

This item concerns the following application(s): ePassport, eID, eSign.

206 *Application note 63:* The user authenticated after a successfully performed PACE protocol is a PACE terminal (PCT). In case eID-PIN or eID-PUK were used for PACE, it is the RP\_Card holder using PCT. Please note that neither CAN nor MRZ effectively represent secrets, but are restricted-revealable; i.e. in case CAN or MRZ were used for PACE, it is either the RP\_Card holder itself or an authorised other person or device.  
If PACE was successfully performed, secure messaging is started using the derived session keys (PACE-K<sub>MAC</sub>, PACE-K<sub>Enc</sub>), cf. FTP\_ITC.1/PACE.

#### 207 FIA\_UAU.1/Rightful\_Terminal    Timing of authentication

Hierarchical to:      No other components.

Dependencies:      FIA\_UID.1 Timing of identification: fulfilled by  
FIA\_UID.1/Rightful\_Terminal

FIA\_UAU.1.1      The TSF shall allow

1. establishing a communication channel
2. carrying out the PACE protocol according to [12], sec. 4.2,
3. carrying out the Terminal Authentication Protocol according to [12], sec. 4.4, version 2 (for GAP)<sup>144,145</sup>

on behalf of the user to be performed before the user is authenticated.

FIA\_UAU.1.2      The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

This item concerns the following application(s): ePassport, eID, eSign.

208 *Application note 64:* The user authenticated after a successfully performed TA protocol is a Service Provider represented by a rightful terminal, i.e. for GAP: either EIS-GAP or ATT or SGT. The authenticated terminal will immediately perform the Chip Authentication (version 2) as required by FIA\_API.1/CA using, amongst other, Comp(ephem-PK<sub>PCD</sub>-TA) from the accomplished TA. Please note that the Passive Authentication using SO<sub>C</sub> is considered to be part of the CA protocol within this PP.  
Please note that the Terminal Authentication Protocol according to [12], sec. 4.4, version 1 (for AIP) is covered by [6] (see FIA\_UAU.1 there). In this case, the user authenticated after a

---

<sup>143</sup> [assignment: *list of TSF-mediated actions*]

<sup>144</sup> RP\_Card identifies itself within the TA protocol by using the identifier ID<sub>PICC</sub>  $\equiv$  Comp(ephem-PK<sub>PICC</sub>-PACE).

<sup>145</sup> [assignment: *list of TSF-mediated actions*]

successfully performed TA protocol is also a Service Provider, concretely, an inspection system using EIS-AIP-BAC.

**209 FIA\_UAU.4 Single-use authentication of the Terminals by the TOE**

Hierarchical to: No other components.

Dependencies: No dependencies.

FIA\_UAU.4.1 The TSF shall prevent reuse of authentication data related to

1. PACE Protocol according to [12], sec. 4.2.
2. Terminal Authentication Protocol according to [12], sec. 4.4, version 2 (for GAP).<sup>146</sup>

This item concerns the following application(s): ePassport, eID, eSign.

210 *Application note 65:* For the PACE protocol, the TOE randomly selects a nonce  $s$  of 128 bits length being (almost) uniformly distributed (the current PP supports the key derivation function based on AES; see [12], sec. A.3.3 and A.2.3). For the TA protocol, the TOE randomly selects a nonce  $r_{\text{PICC}}$  of 64 bits length, see [12], sec. B.3 and B.11.6.  
Please note that the Terminal Authentication Protocol according to [12], sec. 4.4, version 1 (for AIP) is covered by [6] (see FIA\_UAU.4 there).

**211 FIA\_UAU.5 Multiple authentication mechanisms**

Hierarchical to: No other components.

Dependencies: No dependencies.

---

<sup>146</sup> [assignment: *identified authentication mechanism(s)*]

FIA\_UAU.5.1

The TSF shall provide

the General Authentication Procedure as the sequence

1. PACE Protocol according to [12], sec. 4.2,
2. Terminal Authentication Protocol according to [12], sec. 4.4, version 2,
3. Chip Authentication Protocol according to [12], sec. 4.3, version 2<sup>147</sup>,

and

4. Secure messaging in encrypt-then-authenticate mode according to [12], Appendix F<sup>148</sup>

to support user authentication.

FIA\_UAU.5.2

The TSF shall authenticate any user's claimed identity according to the following rules:

1. The TOE accepts the authentication attempt by means of the Terminal Authentication Protocol, only if (i) the terminal presents its static public key<sup>149</sup> being successfully verifiable up to CVCA and (ii) the terminal uses the PICC identifier<sup>150</sup> calculated during and the secure messaging established by the current PACE authentication.
2. Having successfully run the Chip Authentication Protocol the TOE accepts only received commands with correct message authentication code sent by means of secure messaging with the key agreed with the terminal by means of the Chip Authentication Protocol.<sup>151</sup>

This item concerns the following application(s): ePassport, eID, eSign.

212 *Application note 66:* Please note that Chip Authentication Protocol does not authenticate any TOE's user, but provides evidence enabling an external entity (the terminal connected) to prove the TOE's identity.

Please note that the Chip Authentication Protocol according to [12], sec. 4.3, version 1 (for AIP) is covered in this context by [6] (see FIA\_UAU.5 there).

213 FIA\_UAU.6

**Re-authenticating of Terminal by the TOE**

---

<sup>147</sup> the Passive Authentication using SO<sub>C</sub> is considered to be part of the Chip Authentication (CA) Protocol within this PP.

<sup>148</sup> [assignment: *list of multiple authentication mechanisms*]

<sup>149</sup> PK<sub>PCD</sub>

<sup>150</sup> ID<sub>PICC</sub> ≡ Comp(ephem-PK<sub>PICC</sub>-PACE)

<sup>151</sup> [assignment: *rules describing how the multiple authentication mechanisms provide authentication*]

Hierarchical to:	No other components.
Dependencies:	No dependencies.
FIA_UAU.6.1	The TSF shall re-authenticate the user under the conditions <u>each command sent to the TOE after successful run of the Chip Authentication Protocol shall be verified as being sent by the rightful terminal.</u> <sup>152</sup>

This item concerns the following application(s): ePassport, eID, eSign.

214 *Application note 67:* The PACE and the Chip Authentication protocols specified in [12] start secure messaging used for all commands exchanged after successful PACE authentication and CA. The TOE checks each command by secure messaging in encrypt-then-authenticate mode based on CMAC, whether it was sent by the successfully authenticated terminal (see FCS\_COP.1/CMAC for further details). The TOE does not execute any command with incorrect message authentication code. Therefore, the TOE re-authenticates the terminal connected, if a secure messaging error occurred, and accepts only those commands received from the initially authenticated terminal. For the Terminal Authentication, the current secure messaging session is bounded on Comp(ephem-PK<sub>PCD</sub>-TA).

215 The current PP also includes all SFRs of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application. For the functional class FIA, there are the following components:

SFR identifier from [6]	Equivalent to / covered by item in the current PP	Comments
FIA_UID.1/ICAO-EAC	-	is akin to FIA_UID.1/Rightful_Terminal and covers the TA protocol version 1 (for AIP) in [12], sec. 4.4
FIA_UAU.1/ICAO-EAC	-	is akin to FIA_UAU.1/Rightful_Terminal and covers the TA protocol version 1 (for AIP) in [12], sec. 4.4
FIA_UAU.4/ICAO-EAC	-	is akin to FIA_UID.4 and covers the TA protocol version 1 (for AIP) in [12], sec. 4.4
FIA_UAU.5/ICAO-EAC	-	is akin to FIA_UID.5 and covers the CA and TA protocols version 1 (for AIP) in [12], sec. 4.3, 4.4.
FIA_UAU.6/ICAO-EAC	FIA_UID.6	-
FIA_API.1/ICAO-EAC	-	is akin to FIA_API.1/CA and covers the CA protocol version 1 (for AIP) in [12], sec. 4.3.

<sup>152</sup> [assignment: *list of conditions under which re-authentication is required*]

216 The current PP also includes all SFRs of the PACE-Pass PP [7]. Formally, they only concern the *ePassport* application. For the functional class FIA, there are the following components:

SFR identifier from [7]	Equivalent to / covered by item in the current PP	Comments
FIA_AFL.1/PACE_PACE-Pass	FIA_AFL.1/PACE	-
FIA_APO.1/PA_PACE-Pass	-	Performing Passive Authentication according to [12], sec. 1.1 using SO <sub>D</sub> .
FIA_UID.1/PACE_PACE-Pass	FIA_UID.1/PACE	-
FIA_UAU.1/PACE_PACE-Pass	FIA_UAU.1/PACE	-
FIA_UAU.4/PACE-Pass	FIA_UAU.4	-
FIA_UAU.5/PACE-Pass	FIA_UAU.5	-
FIA_UAU.6/PACE-Pass	FIA_UAU.6	-

217 The current PP also includes all SFRs of the SSCD PP [8]. These items are applicable, if the *eSign* application is operational. Formally, they only concern the *eSign* application. For the functional class FIA, there are the following components, whereby the component FIA\_UAU.1/SSCD is explicitly re-defined (supplemented) in the current PP:

#### 218 FIA\_UAU.1/SSCD

#### Timing of authentication

- Hierarchical to: No other components.
- Dependencies: FIA\_UID.1 Timing of identification: fulfilled by FIA\_UID.1/SSCD, cf. [8]
- FIA\_UAU.1.1 The TSF shall allow
1. self test according to FPT\_TST.1,
  2. identification of the user by means of TSF required by FIA\_UID.1/SSCD in [8],
  3. establishing a trusted channel between CGA and the TOE by means of TSF required by FTP\_ITC.1/CA<sup>153</sup>,
  4. establishing a trusted channel between HID and the TOE by means of TSF required by FTP\_ITC.1/CA<sup>154</sup>,
  5. [assignment: list of additional TSF-mediated actions]<sup>155</sup>
- on behalf of the user to be performed before the user is authenticated.

<sup>153</sup> the authenticated terminal is ATT, cf. FIA\_UAU.1/Rightful\_Terminal

<sup>154</sup> the authenticated terminal is SGT, cf. FIA\_UAU.1/Rightful\_Terminal; the trusted channel by FTP\_ITC.1/CA implements a trusted path between HID and the TOE.

FIA\_UAU.1.2 The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

This item concerns the following application(s): eSign.

SFR identifier from [8]	Equivalent to / covered by item in the current PP	Comments
FIA_UID.1/SSCD	-	This requirement concerns dedicated authentication data for the eSign application like eSign-PIN and eSign-PUK, if any.
FIA_AFL.1/SSCD	-	This requirement concerns dedicated authentication data for the eSign application like eSign-PIN and eSign-PUK, if any.

#### 6.1.4 Class FDP User Data Protection

##### 219 FDP\_ACC.1/TRM

##### Subset access control – Terminal Access

Hierarchical to: No other components.

Dependencies: FDP\_ACF.1 Security attribute based access control: fulfilled by FDP\_ACF.1/TRM

FDP\_ACC.1.1 The TSF shall enforce the Terminal Access Control SFP <sup>156</sup> on terminals gaining write, read, modification and usage access to the User Data stored in the RP\_Card <sup>157</sup>.

This item concerns the following application(s): ePassport, eID, eSign.

##### 220 FDP\_ACF.1/TRM

##### Security attribute based access control – Terminal Access

Hierarchical to: No other components.

<sup>155</sup> [assignment: *list of TSF mediated actions*]

<sup>156</sup> [assignment: *access control SFP*]

<sup>157</sup> [assignment: *list of subjects, objects, and operations among subjects and objects covered by the SFP*]

Dependencies:	FDP_ACC.1 Subset access control: fulfilled by FDP_ACC.1/TRM FMT_MSA.3 Static attribute initialisation: not fulfilled, but <b>justified</b> The access control TSF according to FDP_ACF.1/TRM uses security attributes having been defined during the personalisation and fixed over the whole life time of the TOE. No management of these security attributes (i.e. SFR FMT_MSA.1 and FMT_MSA.3) is necessary here.
FDP_ACF.1.1	The TSF shall enforce the <u>Terminal Access Control SFP</u> <sup>158</sup> to objects based on the following: <ol style="list-style-type: none"><li>1. <u>Subjects</u>:<ol style="list-style-type: none"><li>a. <u>Terminal</u>,</li><li>b. <u>PACE Terminal (PCT equiv. BIS-PACE)</u>,</li><li>c. <u>Rightful Terminal (EIS-AIP-BAC, EIS-GAP, ATT, SGT)</u>;</li></ol></li><li>2. <u>Objects</u>: <u>User Data stored in the TOE</u>;</li><li>3. <u>Security attributes</u>:<ol style="list-style-type: none"><li>a. <u>Authentication status of terminals</u>,</li><li>b. <u>Terminal Authorisation Level</u>,</li><li>c. <u>CA authentication status</u>,</li><li>d. <u>Authentication status of the RP_Card holder as Signatory (if the eSign is operational)</u> <sup>159</sup>.</li></ol></li></ol>
FDP_ACF.1.2	The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: <ol style="list-style-type: none"><li>1. <u>a successfully authenticated EIS-GAP is allowed to read User Data according to [12], sec. C.4.1 after a successful CA as required by FIA_API.1/CA.</u></li><li>2. <u>a successfully authenticated Authentication Terminal (ATT) is allowed to read, modify and write User Data as well as to generate signature key pair(s) within the eSign application (SCD/SVD<sup>160</sup>) according to [12], sec. C.4.2 after a successful CA as required by FIA_API.1/CA.</u></li><li>3. <u>a successfully authenticated Signature Terminal (SGT) is allowed to use the private signature key within the eSign application (SCD, if the eSign is operational) for generating electronic signatures according to [12], sec. C.4.3 after a successful CA as required by FIA_API.1/CA and a successful authentication of the RP_Card holder as Signatory as required by FIA_UAU.1/SSCD.</u> <sup>161</sup></li></ol>
FDP_ACF.1.3	The TSF shall explicitly authorise access of subjects to objects based on

---

<sup>158</sup> [assignment: *access control SFP*]

<sup>159</sup> [assignment: *list of subjects and objects controlled under the indicated SFP, and, for each, the SFP-relevant security attributes, or named groups of SFP-relevant security attributes*]

<sup>160</sup> as required by FCS\_CKM.1/SSCD

<sup>161</sup> [assignment: *rules governing access among controlled subjects and controlled objects using controlled operations on controlled objects*]

<sup>162</sup> biometric: finger

the following additional rules:

4. A successfully authenticated EIS-AIP-BAC is allowed to read User Data (only DG3 and DG4) according to [12], sec. 1.1 (ICAO/EAC version 1), G.3 and C.4.1 after a successful TA as required by FIA\_UAU.1/ICAO-EAC (this rule is inherited from [6]).
5. A BIS-PACE (PCT) is allowed to read User Data (except DG3<sup>162</sup> and DG4<sup>163</sup>) according to [12], sec. 1.1 and G.2 after a successful PACE authentication as required by FIA\_UAU.1/PACE\_PACE-Pass (this rule is inherited from [7]).<sup>164</sup>

FDP\_ACF.1.4

The TSF shall explicitly deny access of subjects to objects based on the following additional rules:

1. Any terminal being not authenticated as a rightful terminal (i.e. as either BIS-PACE or EIS-AIP-BAC or EIS-GAP or ATT or SGT) is not allowed to read, to write, to modify, to use any User Data stored on the RP\_Card.
2. Nobody is allowed to read 'TOE immanent secret cryptographic keys' stored on the RP\_Card.
3. Nobody is allowed to read 'secret RP\_Card holder authentication data' stored on the RP\_Card.
4. Nobody is allowed to read the private Restricted Identification (SK<sub>ID</sub>) key stored on the RP\_Card.
5. Nobody is allowed to read the private signature key(s) within the eSign application (SCD; if the eSign is operational)<sup>165</sup>.

This item concerns the following application(s): ePassport, eID, eSign.

221 *Application note 68:* The relative certificate holder (Service Provider) authorisation is encoded in the Card Verifiable Certificate of the terminals being operated by the Service Provider. The TOE verifies the certificate chain established by the Country Verifying Certification Authority, the Document Verifier Certificate and the Terminal Certificate (cf. FMT\_MTD.3). The Terminal Authorisation Level is the intersection of the Certificate Holder Authorisation in the certificates of the Country Verifying Certification Authority, the Document Verifier Certificate and the Terminal Certificate in a valid certificate chain. It is technically based on Certificate Holder Authorization Template (CHAT), see [12], C.1.5. A CHAT is calculated as an AND-operation from the certificate chain of the terminal and the RP\_Card holder's restricting input at the terminal. This final CHAT reflects the *effective authorisation level*, see [12], sec. 2.3 and is then sent to the TOE by the command 'MSE:Set AT' within the Terminal Authentication (B.3 und B.11.1 of [12]).

222 *Application note 69:* Please note that the Card/Chip Security Object (SO<sub>C</sub>) does not belong to the user data, but to the TSF-data. Read access to the Card/Chip Security Object is ruled by [12], A.1.2 and table A.1 for EF.CardSecurity/EF.ChipSecurity, respectively.  
Also the Document Security Object (SO<sub>D</sub>) stored in EF.SOD (see [9], sec. A.10.4) does not

---

<sup>163</sup> biometric: iris

<sup>164</sup> [assignment: rules, based on security attributes, that explicitly authorise access of subjects to objects]

<sup>165</sup> [assignment: rules, based on security attributes, that explicitly deny access of subjects to objects]

belong to the user data, but to the TSF-data. The Document Security Object can be read out by the PCT as well as after accomplishing the BAC procedure, see [12], G.1.

223 *Application note 70*: Please note that this functional requirement also covers the ability to activate the *eSign* application using the ATT with an appropriate Terminal Authorisation Level, see [12], sec. C.4.2, and acting on behalf of the CSP and upon an application by the RP\_Card holder.

224 *Application note 71*: Please note that the control on the user data transmitted between the TOE and the rightful terminal is addressed by FTP\_ITC.1/CA.

## 225 FDP\_RIP.1

### Subset residual information protection

Hierarchical to: No other components.

Dependencies: No dependencies.

FDP\_RIP.1.1 The TSF shall ensure that any previous information content of a resource is made unavailable upon the [selection: *allocation of the resource to, deallocation of the resource from*] the following objects:

1. the Chip Authentication Private Key  $SK_{PICC}$  (when its temporarily stored value is not to use any more).
2. the secret RP\_Card holder authentication data eID-PIN, eID-PUK, eSign-PIN (RAD; if the *eSign* is operational) (when their temporarily stored values are not to use any more).
3. the session keys ( $PACE-K_{MAC}$ ,  $PACE-K_{Enc}$ ), ( $CA-K_{MAC}$ ,  $CA-K_{Enc}$ ) (by closing related communication session).
4. the ephemeral private key  $ephem-SK_{PICC-PACE}$  (by having generated a DH shared secret  $K^{166}$ ).
5. the private Restricted Identification key  $SK_{ID}$  (when its temporarily stored value is not to use any more).
6. the private signature key of the RP\_Card holder (SCD; if the *eSign* is operational) (when its temporarily stored value is not to use any more).
7. [assignment: *list of objects*].

This item concerns the following application(s): ePassport, eID, eSign.

226 *Application note 72*: The functional family FDP\_RIP possesses such a general character, so that it is applicable not only to user data (as assumed by the class FDP), but also to TSF-data; in this respect it is similar to the functional family FPT\_EMSEC. Applied to cryptographic keys, FDP\_RIP.1 requires a certain quality metric ('any previous information content of a resource is made unavailable') for key's destruction in addition to FCS\_CKM.4 that merely requires a fact of key destruction according to a method/standard.

---

<sup>166</sup> according to [12], sec. 4.2.1, #3.b

227 The current PP also includes all SFRs of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application. For the functional class FDP, there are the following components:

SFR identifier from [6]	Equivalent to / covered by item in the current PP	Comments
FDP_ACC.1/ICAO-EAC	FDP_ACC.1/TRM	-
FDP_ACF.1/ICAO-EAC	FDP_ACF.1/TRM	-
FDP_UCT.1/ICAO-EAC	FTP_ITC.1/CA	for EIS-AIP-BAC
FDP_UIT.1/ICAO-EAC	FTP_ITC.1/CA	for EIS-AIP-BAC

228 The current PP also includes all SFRs of the PACE-Pass PP [7]. Formally, they only concern the *ePassport* application. For the functional class FDP, there are the following components:

SFR identifier from [7]	Equivalent to / covered by item in the current PP	Comments
FDP_ACC.1/TRM_PA CE-Pass	FDP_ACC.1/TRM	-
FDP_ACF.1/TRM_PA CE-Pass	FDP_ACF.1/TRM	-
FDP_RIP.1/PACE-Pass	FDP_RIP.1	-

229 The current PP also includes all SFRs of the SSCD PP [8]. These items are applicable, if the *eSign* application is operational. Formally, they only concern the *eSign* application. For the functional class FDP, there are the following components:

SFR identifier from [8]	Equivalent to / covered by item in the current PP	Comments
FDP_ACC.1/SCD/SV D_Generation_SFP_SS CD	-	-
FDP_ACF.1/SCD/SV D_Generation_SFP_SS CD	-	-

FDP_SDI.2/DTBS_SSCD	-	-

### 6.1.5 Class FTP Trusted Path/Channels

#### 230 FTP\_ITC.1/PACE

#### Inter-TSF trusted channel after PACE

Hierarchical to:	No other components.
Dependencies:	No dependencies.
FTP_ITC.1.1	The TSF shall provide a communication channel between itself and <del>another trusted IT product</del> <b>PACE terminal (PCT) after PACE</b> that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel data from modification or disclosure.
FTP_ITC.1.2	The TSF shall permit <del>another trusted IT product</del> <b>the PCT</b> <sup>167</sup> to initiate communication via the trusted channel.
FTP_ITC.1.3	The TSF shall <del>initiate</del> <b>enforce</b> communication via the trusted channel for <u>any data exchange between the TOE and the PCT after PACE.</u> <sup>168</sup>

This item concerns the following application(s): ePassport, eID, eSign.

<sup>167</sup> [selection: the TSF, another trusted IT product]

<sup>168</sup> [assignment: list of functions for which a trusted channel is required]

231 *Application note 73:* The trusted channel is established after successful performing the PACE protocol (FIA\_UAU.1/PACE). If the PACE was successfully performed, secure messaging is immediately started using the derived session keys (PACE-K<sub>MAC</sub>, PACE-K<sub>Enc</sub>): this secure messaging enforces preventing tracing while establishing Chip Authentication; the cryptographic primitives being used for the secure messaging are as required by FCS\_COP.1/AES and FCS\_COP.1/CMAC.

The PACE secure messaging session is immediately superseded by a CA secure messaging session after successful Chip Authentication as required by FTP\_ITC.1/CA.

The establishing phase of the PACE trusted channel does not enable tracing due to the requirements FIA\_AFL.1/PACE and FIA\_AFL.1/eID-PIN\_Blocking.

## 232 FTP\_ITC.1/CA

## Inter-TSF trusted channel after CA

Hierarchical to: No other components.

Dependencies: No dependencies.

FTP\_ITC.1.1 The TSF shall provide a communication channel between itself and ~~another trusted IT product~~ **rightful terminal (EIS-AIP-BAC, EIS-GAP, ATT, SGT) after Chip Authentication** that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel data from modification or disclosure.

FTP\_ITC.1.2 The TSF shall permit ~~another trusted IT product~~ **the rightful terminal (EIS-AIP-BAC, EIS-GAP, ATT, SGT)**<sup>169</sup> to initiate communication via the trusted channel.

FTP\_ITC.1.3 The TSF shall ~~initiate~~ **enforce** communication via the trusted channel for any data exchange between the TOE and the Service Provider represented by the rightful terminal after Chip Authentication.<sup>170</sup>

This item concerns the following application(s): ePassport, eID, eSign.

233 *Application note 74:* The trusted channel is established after successful performing the PACE protocol (FIA\_UAU.1/PACE), the TA protocol (FIA\_UAU.1/Rightful\_Terminal for GAP or FIA\_UAU.1/ICAO-EAC for AIP) and the CA protocol (FIA\_API.1/CA for GAP or FIA\_API.1/ICAO-EAC for AIP). If the Chip Authentication was successfully performed, secure messaging is immediately restarted using the derived session keys (CA-K<sub>MAC</sub>, CA-K<sub>Enc</sub>)<sup>171</sup>: this secure messaging enforces the required properties of *operational* trusted channel; the cryptographic primitives being used for the secure messaging are as required by (i) FCS\_COP.1/AES and FCS\_COP.1/CMAC for GAP or (ii) FCS\_COP.1/SYM\_ICAO-EAC and FCS\_COP.1/MAC\_ICAO-EAC for AIP being compliant with [6].

234 *Application note 75:* Please note that the control on the user data stored in the TOE is addressed by FDP\_ACF.1/TRM.

---

<sup>169</sup> [selection: the TSF, another trusted IT product]

<sup>170</sup> [assignment: list of functions for which a trusted channel is required]

<sup>171</sup> otherwise, secure messaging is continued using the previously established session keys (PACE-K<sub>MAC</sub>, PACE-K<sub>Enc</sub>), cf. FTP\_ITC.1/PACE.

235 *Application note 76*: The requirement FTP\_ITC.1/CA also covers a secure transport of (i) SVD<sup>172</sup> from the TOE to CGA<sup>173</sup> as well as of (ii) VAD<sup>174</sup> from HID<sup>175</sup> and of (iii) DTBS<sup>176</sup> from SCA<sup>175</sup> to the TOE. It also covers TOE's capability to generate and to provide CGA with evidence that can be used as a guarantee of the validity of SVD. The current SFR reflects the main additional security feature concerning the eSign application comparing to [8].

236 The current PP also includes all SFRs of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application. For the functional class FTP, there are no components there.

237 The current PP also includes all SFRs of the PACE-Pass PP [7]. Formally, they only concern the *ePassport* application. For the functional class FTP, there are the following components:

SFR identifier from [7]	Equivalent to / covered by item in the current PP	Comments
FTP_ITC.1/PACE_PACE-Pass	FTP_ITC.1/PACE	-

238 The current PP also includes all SFRs of the SSCD PP [8]. Formally, they only concern the *eSign* application. For the functional class FTP, there are no components there.

### 6.1.6 Class FAU Security Audit

#### 239 FAU\_SAS.1 Audit storage

Hierarchical to: No other components.

Dependencies: No dependencies.

FAU\_SAS.1.1 The TSF shall provide the Manufacturer<sup>177</sup> with the capability to store the Initialisation and Pre-Personalisation Data<sup>178</sup> in the audit records.

This item concerns the following application(s): ePassport, eID, eSign.

<sup>172</sup> integrity is to secure

<sup>173</sup> the authenticated terminal is ATT with bits 7 (install qualified certificate) or/and 6 (install certificate) set to 1, cf. [12], sec. C.4.2.

<sup>174</sup> confidentiality is to secure

<sup>175</sup> the authenticated terminal is SGT

<sup>176</sup> integrity is to secure

<sup>177</sup> [assignment: *authorised users*]

<sup>178</sup> [assignment: *list of audit information*]

240 *Application note 77*: The Manufacturer role is the default user identity assumed by the TOE in the life cycle phase ‘manufacturing’. The IC manufacturer and the RP\_Card manufacturer in the Manufacturer role write the Initialisation and/or Pre-personalisation Data as TSF-data into the TOE. The audit records are usually write-only-once data of the RP\_Card (see FMT\_MTD.1/INI\_ENA, FMT\_MTD.1/INI\_DIS). Please note that there could also be such audit records which cannot be read out, but directly used by the TOE.

241 The current PP also includes all SFRs of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application. For the functional class FAU, there are the following components:

SFR identifier from [6]	Equivalent to / covered by item in the current PP	Comments
FAU_SAS.1/ICAO-EAC	FAU_SAS.1	-

242 The current PP also includes all SFRs of the PACE-Pass PP [7]. Formally, they only concern the *ePassport* application. For the functional class FAU, there are the following components:

SFR identifier from [7]	Equivalent to / covered by item in the current PP	Comments
FAU_SAS.1/PACE-Pass	FAU_SAS.1	-

243 The current PP also includes all SFRs of the SSCD PP [8]. Formally, they only concern the *eSign* application. For the functional class FAU, there are no components there.

### 6.1.7 Class FMT Security Management

244 The SFR FMT\_SMF.1 and FMT\_SMR.1 provide basic requirements on the management of the TSF data.

#### 245 **FMT\_SMF.1** **Specification of Management Functions**

- Hierarchical to: No other components.
- Dependencies: No dependencies.
- FMT\_SMF.1.1 The TSF shall be capable of performing the following management functions:
1. Initialisation,
  2. Personalisation,
  3. Configuration,

4. Resume and unblock the eID-PIN<sup>179</sup>,
5. Activate and deactivate the eID-PIN.<sup>180</sup>

This item concerns the following application(s): ePassport, eID, eSign.

## 246 FMT\_SMR.1

### Security roles

Hierarchical to:	No other components.
Dependencies:	FIA_UID.1 Timing of identification: fulfilled by FIA_UID.1/PACE, FIA_UID.1/Rightful_Terminal see also the <i>Application note 78</i> below.
FMT_SMR.1.1	<p>The TSF shall maintain the roles</p> <ol style="list-style-type: none"><li>1. <u>Manufacturer.</u></li><li>2. <u>Personalisation Agent.</u></li><li>3. <u>Country Verifying Certification Authority.</u></li><li>4. <u>Document Verifier.</u></li><li>5. <u>Terminal.</u></li><li>6. <u>PACE Terminal (PCT equiv. BIS-PACE).</u></li><li>7. <u>Extended Inspection System using AIP with BAC (EIS-AIP-BAC).</u></li><li>8. <u>Extended Inspection System using GAP (EIS-GAP).</u></li><li>9. <u>Authentication Terminal (ATT).</u></li><li>10. <u>Signature Terminal (SGT).</u></li><li>11. <u>RP_Card holder.</u><sup>181</sup></li></ol>
FMT_SMR.1.2	The TSF shall be able to associate users with roles.

This item concerns the following application(s): ePassport, eID, eSign.

247 *Application note 78*: For explanation on the role Manufacturer please refer to the *Application note 77*; on the role Personalisation Agent – to the *Application note 62*.

The role Terminal is the default role for any terminal being recognised by the TOE as neither PCT nor EIS-AIP-BAC nor EIS-GAP nor ATT nor SGT ('Terminal' is used by the RP\_Card presenter). The roles CVCA, DV, EIS-AIP-BAC, EIS-GAP, ATT<sup>182</sup> and SGT are recognised by analysing the current Terminal Certificate C<sub>T</sub>, cf. [12], C.4 (FIA\_UAU.1/Rightful\_Terminal for GAP or FIA\_UAU.1/ICAO-EAC for AIP).

The TOE recognises the RP\_Card holder by using PCT upon input eID-PIN or eID-PUK

---

<sup>179</sup> unblocking eSign-PIN is managed by FMT\_SMF.1/SSCD

<sup>180</sup> [assignment: *list of management functions to be provided by the TSF*]

<sup>181</sup> [assignment: *the authorised identified roles*]

<sup>182</sup> ATT plays a special role 'CGA' for the *eSign* application, if bits 7 (install qualified certificate) or/and 6 (install certificate) are set to 1 within the effective terminal authorisation level, cf. [12], sec. C.4.2; an ATT with such a terminal authorisation level is authorised by the related CSP to act as CGA on its behalf.

(FIA\_UAU.1/PACE) as well as – in the context of the eSign application – by using SGT upon input eSign-PIN (FIA\_UAU.1/SSCD).

248 The SFR FMT\_LIM.1 and FMT\_LIM.2 address the management of the TSF and TSF data to prevent misuse of test features of the TOE over the life cycle phases.

**249 FMT\_LIM.1 Limited capabilities**

Hierarchical to:	No other components.
Dependencies:	FMT_LIM.2 Limited availability: fulfilled by FMT_LIM.2
FMT_LIM.1.1	<p>The TSF shall be designed in a manner that limits their capabilities so that in conjunction with ‘Limited availability (FMT_LIM.2)’ the following policy is enforced:</p> <p><u>Deploying test features after TOE delivery do not allow</u></p> <ol style="list-style-type: none"><li>1. <u>User Data to be manipulated and disclosed.</u></li><li>2. <u>TSF data to be manipulated or disclosed.</u></li><li>3. <u>embedded software to be reconstructed and</u></li><li>4. <u>substantial information about construction of TSF to be gathered which may enable other attacks.</u><sup>183</sup></li></ol>

This item concerns the following application(s): ePassport, eID, eSign.

**250 FMT\_LIM.2 Limited availability**

Hierarchical to:	No other components.
Dependencies:	FMT_LIM.1 Limited capabilities: fulfilled by FMT_LIM.1
FMT_LIM.2.1	<p>The TSF shall be designed in a manner that limits their availability so that in conjunction with ‘Limited capabilities (FMT_LIM.1)’ the following policy is enforced:</p> <p><u>Deploying test features after TOE delivery do not allow</u></p> <ol style="list-style-type: none"><li>1. <u>User Data to be manipulated and disclosed.</u></li><li>2. <u>TSF data to be manipulated or disclosed.</u></li><li>3. <u>embedded software to be reconstructed and</u></li><li>4. <u>substantial information about construction of TSF to be gathered which may enable other attacks.</u><sup>184</sup></li></ol>

This item concerns the following application(s): ePassport, eID, eSign.

<sup>183</sup> [assignment: *Limited capability and availability policy*]

<sup>184</sup> [assignment: *Limited capability and availability policy*]

251 FMT\_MTD.1/INI\_ENA

**Management of TSF data – Writing Initialisation and Pre-personalisation Data**

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>write</u> <sup>185</sup> the <u>Initialisation Data and Pre-personalisation Data</u> <sup>186</sup> to <u>the Manufacturer</u> . <sup>187</sup>

This item concerns the following application(s): ePassport, eID, eSign.

252 FMT\_MTD.1/INI\_DIS

**Management of TSF data – Reading and Using Initialisation and Pre-personalisation Data**

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>read out and to use</u> <sup>188</sup> the <u>Initialisation Data</u> <sup>189</sup> to <u>the Personalisation Agent</u> . <sup>190</sup>

This item concerns the following application(s): ePassport, eID, eSign.

253 *Application note 79:* The TOE may restrict the ability to write the Initialisation Data and the Pre-personalisation Data by (i) allowing writing these data only once and (ii) blocking the role Manufacturer at the end of the manufacturing phase. The Manufacturer may write the Initialisation Data (as required by FAU\_SAS.1) including, but being not limited to a unique identification of the IC being used to trace the IC in the life cycle phases ‘manufacturing’ and ‘issuing’, but being not needed and may be misused in the ‘operational use’. Therefore, read and use access to the Initialisation Data shall be blocked in the ‘operational use’ by the Personalisation Agent, when he switches the TOE from the life cycle phase ‘issuing’ to the life cycle phase ‘operational use’. Please also refer to the *Application note 62*.

---

<sup>185</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>186</sup> [assignment: *list of TSF data*]

<sup>187</sup> [assignment: *the authorised identified roles*]

<sup>188</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>189</sup> [assignment: *list of TSF data*]

<sup>190</sup> [assignment: *the authorised identified roles*]

**254 FMT\_MTD.1/CVCA\_INI      Management of TSF data – Initialisation of CVCA Certificate and Current Date**

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>write</u> <sup>191</sup> the <ol style="list-style-type: none"><li>1. <u>initial Country Verifying Certification Authority Public Key (PK<sub>CVCA</sub>)</u>,</li><li>2. <u>metadata of the initial Country Verifying Certification Authority Certificate (C<sub>CVCA</sub>) as required in [12], sec. A.6.2.3,</u></li><li>3. <u>initial Current Date,</u></li><li>4. [assignment: <i>list of TSF data</i>]</li></ol> to [assignment: <i>the authorised identified roles</i> ].

This item concerns the following application(s): ePassport, eID, eSign.

255 *Application note 80:* The initial Country Verifying Certification Authority Public Key may be written by the Manufacturer in the manufacturing phase or by the Personalisation Agent in the issuing phase (cf. [12], sec. 2.2.5). The initial Country Verifying Certification Authority Public Keys (and their updates later on) are used to verify the Country Verifying Certification Authority Link-Certificates. The metadata of the initial Country Verifying Certification Authority Certificate and the initial Current Date are needed for verification of the certificates and the calculation of Terminal Authorisation Level. Please note that only a *subset* of the metadata must be stored in the TOE, see [12], sec. A.6.2.3; storing of further certificate's content is optional.

**256 FMT\_MTD.1/CVCA\_UPD      Management of TSF data – Country Verifying Certification Authority**

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>update</u> <sup>192</sup> the <ol style="list-style-type: none"><li>1. <u>Country Verifying Certification Authority Public Key (PK<sub>CVCA</sub>)</u>,</li><li>2. <u>metadata of the Country Verifying Certification Authority Certificate (C<sub>CVCA</sub>) as required in [12], sec. A.6.2.3,</u></li><li>3. [assignment: <i>list of TSF data</i>]</li></ol> to <u>Country Verifying Certification Authority</u> . <sup>193</sup>

<sup>191</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>192</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>193</sup> [assignment: *the authorised identified roles*]

This item concerns the following application(s): ePassport, eID, eSign.

257 *Application note 81*: The Country Verifying Certification Authority updates its asymmetric key pair and distributes the public key and the related metadata by means of the CVCA Link-Certificates (cf. [12], sec. 2.2). The TOE updates its internal trust-point, if a valid CVCA Link-Certificates (cf. FMT\_MTD.3) is provided by the terminal (cf. [12], sec. 2.2.3 and 2.2.5).

## 258 FMT\_MTD.1/DATE Management of TSF data – Current date

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>modify</u> <sup>194</sup> the <u>Current Date</u> <sup>195</sup> to <ol style="list-style-type: none"> <li>1. <u>Country Verifying Certification Authority</u>,</li> <li>2. <u>Document Verifier</u>,</li> <li>3. <u>Rightful Terminal (EIS-AIP-BAC, EIS-GAP, ATT or SGT) possessing an Accurate Terminal Certificate</u>.<sup>196</sup></li> </ol>

This item concerns the following application(s): ePassport, eID, eSign.

259 *Application note 82*: The authorised roles are identified in their certificates (cf. [12], sec. 2.2.5 and C.4) and authorised by validation of the certificate chain up to CVCA (cf. FMT\_MTD.3). The authorised role of terminal is part of the Certificate Holder Authorization in the card verifiable certificate provided by the terminal within the Terminal Authentication (cf. [12], A.6.2.3, B.11.1, C.1.3, C.1.5, D.2 for details).

## 260 FMT\_MTD.1/PA\_UPD Management of TSF data – Personalisation Agent

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>write</u> <sup>197</sup> the <u>Card/Chip Security Object (SO<sub>C</sub>)</u> and the <u>Document Security Object (SO<sub>D</sub>)</u> <sup>198</sup> to the <u>Personalisation Agent</u> . <sup>199</sup>

<sup>194</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>195</sup> [assignment: *list of TSF data*]

<sup>196</sup> [assignment: *the authorised identified roles*]

<sup>197</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>198</sup> [assignment: *list of TSF data*]

<sup>199</sup> [assignment: *the authorised identified roles*]

This item concerns the following application(s): ePassport, eID, eSign.

- 261 *Application note 83:* By writing SO<sub>C</sub> and SO<sub>D</sub> into the TOE, the Personalisation Agent confirms (on behalf of DS) the correctness and genuineness of all the personalisation data related. The latter consist of user- and TSF- data, as well. Due to this fact and to the scope of the SFR FMT\_MTD.1 (management of TSF-data), the entire set of the personalisation data is formally not addressed above. Nevertheless, FMT\_MTD.1/PA\_UPD shall be understood in the following way: 'The TSF shall restrict the ability to write the personalisation data to the Personalisation Agent.' On the role 'Personalisation Agent' please refer to the *Application note 62*.

**262 FMT\_MTD.1/SK\_PICC                      Management of TSF data – Chip Authentication Private Key**

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to [selection: <i>create, load</i> ] <sup>200</sup> the <u>Chip Authentication Private Key (SK<sub>PICC</sub>)</u> <sup>201</sup> to [assignment: <i>the authorised identified roles</i> ].

This item concerns the following application(s): ePassport, eID, eSign.

- 263 *Application note 84:* The component FMT\_MTD.1/SK\_PICC is refined by (i) selecting other operations and (ii) defining a selection for the operations 'create' and 'load' to be performed by the ST writer. The verb 'load' means here that the Chip Authentication Private Key is securely generated outside the TOE and written into the TOE memory. The verb 'create' means here that the Chip Authentication Private Key is generated by the TOE itself. In the latter case, the ST writer might include an appropriate instantiation of the component FCS\_CKM.1 as SFR for this key generation.

**264 FMT\_MTD.1/KEY\_READ                      Management of TSF data – Private Key Read**

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>read</u> <sup>202</sup> the <u>Chip Authentication Private Key (SK<sub>PICC</sub>)</u> <sup>203</sup> to <u>none</u> . <sup>204</sup>

---

<sup>200</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>201</sup> [assignment: *list of TSF data*]

<sup>202</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>203</sup> [assignment: *list of TSF data*]

<sup>204</sup> [assignment: *the authorised identified roles*]

This item concerns the following application(s): ePassport, eID, eSign.

#### 265 FMT\_MTD.1/eID-PIN\_Resume Management of TSF data – Resuming eID-PIN

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>resume</u> <sup>205</sup> the <u>suspended eID-PIN</u> <sup>206</sup> to the <u>RP_Card holder</u> . <sup>207</sup>

This item concerns the following application(s): eID.

266 *Application note 85:* The resuming procedure is a two-step one, subsequently using PACE with CAN and PACE with eID-PIN. It must be implemented according to [12], sec. 3.5.1 and is relevant for the status as required by FIA\_AFL.1/eID-PIN\_Suspending. The RP\_Card holder is authenticated as required by FIA\_UAU.1/PACE using the eID-PIN as the shared password.

#### 267 FMT\_MTD.1/eID-PIN\_Unblock Management of TSF data – Unblocking/Changing eID-PIN

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1 FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>unblock and change</u> <sup>208</sup> the <u>blocked eID-PIN</u> <sup>209</sup> to 1. <u>the RP_Card holder</u> , 2. <u>the Authentication Terminal (ATT) with the Terminal Authorisation Level for eID-PIN management</u> . <sup>210</sup>

This item concerns the following application(s): eID.

---

<sup>205</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>206</sup> [assignment: *list of TSF data*]

<sup>207</sup> [assignment: *the authorised identified roles*]

<sup>208</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>209</sup> [assignment: *list of TSF data*]

<sup>210</sup> [assignment: *the authorised identified roles*]

268 *Application note 86:* The unblocking procedure must be implemented according to [12], sec. 3.5.1, 3.5.2 and is relevant for the status as required by FIA\_AFL.1/eID-PIN\_Blocking. It can be triggered by either (i) the RP\_Card holder being authenticated as required by FIA\_UAU.1/PACE using the eID-PUK as the shared password or (ii) the ATT (FIA\_UAU.1/Rightful\_Terminal) proved a Terminal Authorisation Level being sufficient for eID-PIN management (FDP\_ACF.1/TRM).

## 269 FMT\_MTD.1/eID-PIN\_Activate Management of TSF data – Activating/Deactivating eID-PIN

Hierarchical to:	No other components.
Dependencies:	FMT_SMF.1 Specification of management functions: fulfilled by FMT_SMF.1
	FMT_SMR.1 Security roles: fulfilled by FMT_SMR.1
FMT_MTD.1.1	The TSF shall restrict the ability to <u>activate and deactivate</u> <sup>211</sup> the <u>eID-PIN</u> <sup>212</sup> to <u>the Authentication Terminal (ATT) with the Terminal Authorisation Level for eID-PIN management.</u> <sup>213</sup>

This item concerns the following application(s): eID, eSign.

270 *Application note 87:* The activating/deactivating procedures must be implemented according to [12], sec. 3.5.2. It can be triggered by the ATT (FIA\_UAU.1/Rightful\_Terminal) proved a Terminal Authorisation Level being sufficient for eID-PIN management (FDP\_ACF.1/TRM).

## 271 FMT\_MTD.3 Secure TSF data

Hierarchical to:	No other components.
Dependencies:	FMT_MTD.1 Management of TSF data: fulfilled by FMT_MTD.1/CVCA_INI, FMT_MTD.1/CVCA_UPD, FMT_MTD.1/DATE
FMT_MTD.3.1	The TSF shall ensure that only secure values <b>of the certificate chain</b> are accepted for <u>TSF data of the Terminal Authentication Protocol and the Terminal Access Control SFP.</u> <sup>214</sup>

**Refinement: The certificate chain is valid if and only if**

---

<sup>211</sup> [selection: *change\_default, query, modify, delete, clear*, [assignment: *other operations*]]

<sup>212</sup> [assignment: *list of TSF data*]

<sup>213</sup> [assignment: *the authorised identified roles*]

<sup>214</sup> [assignment: *list of TSF data*]

- (1) the digital signature of the Terminal Certificate ( $C_T$ ) has been verified as correct using the public key of the Document Verifier Certificate and the expiration date of the  $C_T$  is not before the Current Date of the TOE,
- (2) the digital signature of the Document Verifier Certificate ( $C_{DV}$ ) has been verified as correct using the public key in the Certificate of the Country Verifying Certification Authority ( $C_{CVCA}$ ) and the expiration date of the  $C_{DV}$  is not before the Current Date of the TOE,
- (3) the digital signature of the Certificate of the Country Verifying Certification Authority ( $C_{CVCA}$ ) has been verified as correct using the public key of the Country Verifying Certification Authority known to the TOE and the expiration date of the  $C_{CVCA}$  is not before the Current Date of the TOE.

The static terminal public key ( $PK_{PCD}$ ) contained in the  $C_T$  in a valid certificate chain is a secure value for the authentication reference data of a rightful terminal.

The intersection of the Certificate Holder Authorisations contained in the certificates of a valid certificate chain is a secure value for Terminal Authorisation Level<sup>215</sup> of a successfully authenticated Service Provider (represented by a rightful terminal).

This item concerns the following application(s): ePassport, eID, eSign.

272 *Application note 88:* The Terminal Authentication is used as required by (i) FIA\_UAU.1/Rightful Terminal and FIA\_UAU.5 for GAP or (ii) FIA\_UAU.1/ICAO-EAC and FIA\_UAU.5/ICAO-EAC for AIP. The Terminal Authorisation Level<sup>215</sup> derived from the  $C_{CVCA}$ ,  $C_{DV}$  and  $C_T$  is used as TSF-data for the access control required by FDP\_ACF.1/TRM.

273 The current PP also includes all SFRs of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application. For the functional class FMT, there are the following components:

SFR identifier from [6]	Equivalent to / covered by item in the current PP	Comments
FMT_SMF.1/ICAO-EAC	FMT_SMF.1	-
FMT_SMR.1/ICAO-EAC	FMT_SMR.1	-
FMT_LIM.1/ICAO-EAC	FMT_LIM.1	-
FMT_LIM.2/ICAO-EAC	FMT_LIM.2	-

<sup>215</sup> this certificate-calculated Terminal Authorisation Level can additionally be restricted by RP\_Card holder at the terminal, s. [12], sec. 2.3. It is based on Certificate Holder Authorization Template (CHAT), see [12], C.1.5. A CHAT is calculated as an AND-operation from the certificate chain of the terminal and the RP\_Card holder's restricting input at the terminal. This final CHAT reflects the *effective authorisation level*, see [12], sec. 2.3 and is then sent to the TOE by the command 'MSE:Set AT' within the Terminal Authentication (B.3 und B.11.1 of [12]).

SFR identifier from [6]	Equivalent to / covered by item in the current PP	Comments
FMT_MTD.1/INI_ENA_ICAO-EAC	FMT_MTD.1/INI_ENA	-
FMT_MTD.1/INI_DIS_ICAO-EAC	FMT_MTD.1/INI_DIS	-
FMT_MTD.1/CVCA_INI_ICAO-EAC	FMT_MTD.1/CVCA_INI	-
FMT_MTD.1/CVCA_UPD_ICAO-EAC	FMT_MTD.1/CVCA_UPD	-
FMT_MTD.1/DATE_ICAO-EAC	FMT_MTD.1/DATE	-
FMT_MTD.1/KEY_WRITE_ICAO-EAC	FMT_MTD.1/PA_UPD	For BAC (EIS-AIP-BAC), the Document Basic Access Keys are derived from the value of the MRZ for the concrete instantiation of the TOE, cf. [12], H.1. Therefore, the Document Basic Access Keys are considered as a part of personalisation data. See also the <i>Application note 83</i> above.
FMT_MTD.1/CAPK_ICAO-EAC	FMT_MTD.1/SK_PICC	-
FMT_MTD.1/KEY_READ_ICAO-EAC	FMT_MTD.1/KEY_READ	FMT_MTD.1/KEY_READ shall be understood in such a way that it also covers the Document Basic Access Keys inherited from [6].  The concept of Personalization Agent Keys from [6] is covered in the current PP by using an ATT proven a sufficient Terminal Authorisation Level, see the <i>Application note 62</i> above.
FMT_MTD.3/ICAO-EAC	FMT_MTD.3	-

274 The current PP also includes all SFRs of the PACE-Pass PP [7]. Formally, they only concern the *ePassport* application. For the functional class FMT, there are the following components:

SFR identifier from [7]	Equivalent to / covered by item in the current PP	Comments
FMT_SMF.1/PACE-Pass	FMT_SMF.1	-
FMT_SMR.1/PACE-Pass	FMT_SMR.1	-

SFR identifier from [7]	Equivalent to / covered by item in the current PP	Comments

FMT_MTD.1/Signatory_SSCD	-	eSign-PIN can be unblocked using the card-global eID-PUK and may also be unblocked using an eSign-specific

SFR identifier from [8]	Equivalent to / covered by item in the current PP	Comments
		eSign-PUK, if any.

### 6.1.8 Class FPT Protection of the Security Functions

276 The TOE shall prevent inherent and forced illicit information leakage for the User Data and TSF-data. The security functional requirement FPT\_EMSEC.1 addresses the inherent leakage. With respect to the forced leakage they have to be considered in combination with the security functional requirements 'Failure with preservation of secure state (FPT\_FLS.1)' and 'TSF testing (FPT\_TST.1)' on the one hand and 'Resistance to physical attack (FPT\_PHP.3)' on the other. The SFRs 'Limited capabilities (FMT\_LIM.1)', 'Limited availability (FMT\_LIM.2)' and 'Resistance to physical attack (FPT\_PHP.3)' together with the design measures to be described within the SAR 'Security architecture description' (ADV\_ARC.1) prevent bypassing, deactivation and manipulation of the security features or misuse of the TOE security functionality.

#### 277 FPT\_EMSEC.1 TOE Emanation

Hierarchical to: No other components.

Dependencies: No dependencies.

FPT\_EMSEC.1.1 The TOE shall not emit [*assignment: types of emissions*] in excess of [*assignment: specified limits*] enabling access to

1. the Chip Authentication Private Key (SK<sub>PICC</sub>),
2. the eID-PIN, eID-PUK, eSign-PIN (RAD; if the eSign is operational),
3. the session keys (PACE-K<sub>MAC</sub>, PACE-K<sub>Enc</sub>, (CA-K<sub>MAC</sub>, CA-K<sub>Enc</sub>),
4. the ephemeral private key ephem-SK<sub>PICC</sub>-PACE,
5. [*assignment: list of types of TSF data*]

and

6. the private Restricted Identification key SK<sub>ID</sub>,
7. the private signature key of the RP\_Card holder (SCD; if the eSign is operational),
8. [*assignment: list of types of user data*].

FPT\_EMSEC.1.2 The TSF shall ensure any users<sup>216</sup> are unable to use the following interface RP\_Card's contactless interface and circuit contacts<sup>217</sup> to gain access to

1. the Chip Authentication Private Key (SK<sub>PICC</sub>),

<sup>216</sup> [*assignment: type of users*]

<sup>217</sup> [*assignment: type of connection*]

2. the eID-PIN, eID-PUK, eSign-PIN (RAD; if the eSign is operational),
  3. the session keys (PACE- $K_{MAC}$ , PACE- $K_{Enc}$ ), (CA- $K_{MAC}$ , CA- $K_{Enc}$ ),
  4. the ephemeral private key ephem-SK<sub>PICC-PACE</sub>,
  5. [assignment: *list of types of TSF data*]
- and
6. the private Restricted Identification key SK<sub>ID</sub>,
  7. the private signature key of the RP\_Card holder (SCD; if the eSign is operational),
  8. [assignment: *list of types of user data*].

This item concerns the following application(s): ePassport, eID, eSign.

278 *Application note 89*: The TOE shall prevent attacks against the listed secret data where the attack is based on external observable physical phenomena of the TOE. Such attacks may be observable at the interfaces of the TOE or may be originated from internal operation of the TOE or may be caused by an attacker that varies the physical environment under which the TOE operates. The set of measurable physical phenomena is influenced by the technology employed to implement the smart card. The RP\_Card's chip has to provide a smart card contactless interface, but may have also (not used by the terminal, but maybe by an attacker) sensitive contacts according to ISO/IEC 7816-2 as well. Examples of measurable phenomena include, but are not limited to variations in the power consumption, the timing of signals and the electromagnetic radiation due to internal operations or data transmissions.

279 The following security functional requirements address the protection against forced illicit information leakage including physical manipulation.

#### 280 FPT\_FLS.1

#### Failure with preservation of secure state

- Hierarchical to: No other components.
- Dependencies: No dependencies.
- FPT\_FLS.1.1 The TSF shall preserve a secure state when the following types of failures occur:
1. Exposure to operating conditions causing a TOE malfunction,
  2. Failure detected by TSF according to FPT\_TST.1,
  3. [assignment: *list of types of failures in the TSF*].

This item concerns the following application(s): ePassport, eID, eSign.

#### 281 FPT\_TST.1

#### TSF testing

- Hierarchical to: No other components.

Dependencies:	No dependencies.
FPT_TST.1.1	The TSF shall run a suite of self tests [ <i>selection: during initial start-up, periodically during normal operation, at the request of the authorised user, at the conditions</i> [ <i>assignment: conditions under which self test should occur</i> ]] to demonstrate the correct operation of <u>the TSF</u> <sup>218</sup> .
FPT_TST.1.2	The TSF shall provide authorised users with the capability to verify the integrity of <u>the TSF data</u> <sup>219</sup> .
FPT_TST.1.3	The TSF shall provide authorised users with the capability to verify the integrity of <u>stored TSF executable code</u> <sup>220</sup> .

This item concerns the following application(s): ePassport, eID, eSign.

282 *Application note 90:* If the RP\_Card's chip uses state of the art smart card technology, it will run some self tests at the request of an authorised user and some self tests automatically. E.g. a self test for the verification of the integrity of stored TSF executable code required by FPT\_TST.1.3 may be executed during initial start-up by the 'authorised user' Manufacturer in the life cycle phase 'Manufacturing'. Other self tests may automatically run to detect failures and to preserve the secure state according to FPT\_FLS.1 in the phase 'operational use', e.g. to check a calculation with a private key by the reverse calculation with the corresponding public key as a countermeasure against Differential Failure Analysis.

### 283 FPT\_PHP.3 Resistance to physical attack

Hierarchical to:	No other components.
Dependencies:	No dependencies.
FPT_PHP.3.1	The TSF shall resist <u>physical manipulation and physical probing</u> <sup>221</sup> to the <u>TSF</u> <sup>222</sup> by responding automatically such that the SFRs are always enforced.

This item concerns the following application(s): ePassport, eID, eSign.

284 *Application note 91:* The TOE will implement appropriate measures to continuously counter physical manipulation and physical probing. Due to the nature of these attacks (especially manipulation) the TOE can by no means detect attacks on all of its elements. Therefore, permanent protection against these attacks is required ensuring that the TSP could not be violated at any time. Hence, 'automatic response' means here (i) assuming that there might be an attack at any time and (ii) countermeasures are provided at any time.

---

<sup>218</sup> [selection: [*assignment: parts of TSF*], the TSF]

<sup>219</sup> [selection: [*assignment: parts of TSF*], TSF data]

<sup>220</sup> [selection: [*assignment: parts of TSF*], TSF]

<sup>221</sup> [assignment: *physical tampering scenarios*]

<sup>222</sup> [assignment: *list of TSF devices/elements*]

285 The current PP also includes all SFRs of the ICAO-EAC PP [6]. Formally, they only concern the *ePassport* application. For the functional class FPT, there are the following components:

SFR identifier from [6]	Equivalent to / covered by item in the current PP	Comments
FPT_EMSEC.1/ICAO-EAC	FPT_EMSEC.1	-
FPT_FLS.1/ICAO-EAC	FPT_FLS.1	-
FPT_TST.1/ICAO-EAC	FPT_TST.1	-
FPT_PHP.3/ICAO-EAC	FPT_PHP.3	-

286 The current PP also includes all SFRs of the PACE-Pass PP [7]. Formally, they only concern the *ePassport* application. For the functional class FPT, there are the following components:

SFR identifier from [7]	Equivalent to / covered by item in the current PP	Comments
FPT_EMSEC.1/PACE-Pass	FPT_EMSEC.1	-
FPT_FLS.1/PACE-Pass	FPT_FLS.1	-
FPT_TST.1/PACE-Pass	FPT_TST.1	-
FPT_PHP.3/PACE-Pass	FPT_PHP.3	-

287 The current PP also includes all SFRs of the SSCD PP [8]. These items are applicable, if the *eSign* application is operational. Formally, they only concern the *eSign* application. For the functional class FPT, there are the following components:

SFR identifier from [8]	Equivalent to / covered by item in the current PP	Comments
FPT_EMSEC.1/SSCD	FPT_EMSEC.1	-
FPT_FLS.1/SSCD	FPT_FLS.1	-

SFR identifier from [8]	Equivalent to / covered by item in the current PP	Comments
FPT_PHP.1/SSCD	FPT_PHP.3	-
FPT_PHP.3/SSCD	FPT_PHP.3	-
FPT_TST.1/SSCD	FPT_TST.1	-

## 6.2 Security Assurance Requirements for the TOE

288 The assurance requirements for the evaluation of the TOE, its development and operating environment are to choose as the predefined assurance package EAL4 augmented by the following components:

- ALC\_DVS.2 (Sufficiency of security measures),
- ATE\_DPT.2 (Testing: security enforcing modules) and
- AVA\_VAN.5 (Advanced methodical vulnerability analysis).

## 6.3 Security Requirements Rationale

### 6.3.1 Security Functional Requirements Rationale

289 The following table provides an overview for security functional requirements coverage also giving an evidence for *sufficiency* and *necessity* of the SFRs chosen.

	OT.Identification	OT.Personalisation	OT.Data_Integrity	OT.Data_Authenticity	OT.Data_Confidentiality	OT.Tracing	OT.Chip_Auth_Proof	OT.Prot_Abuse-Func	OT.Prot_Inf_Leak	OT.Prot_Phys-Tamper	OT.Prot_Malfuntion	OT.SCD/SVD_Gen [8] <sup>223</sup>	OT.Sigy_SigF [8] <sup>223</sup>

**Table 24: Coverage of Security Objectives for the TOE by SFR**

290 A detailed justification required for *suitability* of the security functional requirements to achieve the security objectives is given below.

291 The security objective **OT.Identification** addresses the storage of Initialisation and Pre-Personalisation Data in its non-volatile memory, whereby they also include the IC Identification Data uniquely identifying the TOE's chip.

This will be ensured by TSF according to SFR FAU\_SAS.1.

The SFR FMT\_MTD.1/INI\_ENA allows only the Manufacturer to write Initialisation and Pre-personalisation Data (including the Personalisation Agent key). The SFR FMT\_MTD.1/INI\_DIS requires the Personalisation Agent to disable access to Initialisation and Pre-personalisation Data in the life cycle phase 'operational use'.

The SFRs FMT\_SMF.1 and FMT\_SMR.1 support the functions and roles related.

292 The security objective **OT.Personalisation** aims that only Personalisation Agent can write the User- and the TSF-data into the TOE (it also includes installing/activating of the *eSign* application).

This property is covered by FDP\_ACC.1/TRM and FDP\_ACF.1/TRM requiring, amongst other, an appropriate authorisation level of a rightful terminal. This authorisation level can be achieved by the terminal identification/authentication as required by the SFR FIA\_UID.1/Rightful\_Terminal, FIA\_UAU.1/Rightful\_Terminal<sup>224</sup>. Since only an ATT can reach the necessary authorisation level, using and management of eID-PIN (FIA\_AFL.1/eID-PIN\_Suspending, FIA\_AFL.1/eID-PIN\_Blocking, FMT\_MTD.1/eID-PIN\_Resume, FMT\_MTD.1/eID-PIN\_Unblock, FMT\_MTD.1/eID-PIN\_Activate) also support achievement of this objective. FDP\_RIP.1 requires erasing the temporal values of eID-PIN, eID-PUK.

The justification for the SFRs FAU\_SAS.1, FMT\_MTD.1/INI\_ENA and FMT\_MTD.1/INI\_DIS arises from the justification for OT.Identification above with respect to the Pre-personalisation

<sup>224</sup> which, in turn, are supported by the related FCS-components. The author dispensed here with listing of these supporting FCS-components for the sake of clearness. See the next item OT.Data\_Integrity for further detail.

Data.

FMT\_MTD.1/PA\_UPD covers the related property of OT.Personalisation (writing/updating SO<sub>C</sub> and SO<sub>D</sub> and, in generally, personalisation data).

The SFRs FMT\_SMF.1 and FMT\_SMR.1 support the functions and roles related.

- 293 The security objective **OT.Data\_Integrity** aims that the TOE always ensures integrity of the User- and TSF-data stored and, after the Terminal- and the Chip Authentication, of these data exchanged (physical manipulation and unauthorised modifying).

Physical manipulation is addressed by FPT\_PHP.3.

Unauthorised modifying of the stored data is addressed, in the first line, by FDP\_ACC.1/TRM and FDP\_ACF.1/TRM. A concrete authorisation level is achieved by the terminal identification/authentication as required by the SFRs FIA\_UID.1/Rightful\_Terminal, FIA\_UAU.1/Rightful\_Terminal (is supported by FCS\_COP.1/SIG\_VER). The TA protocol uses the result of the PACE authentication (FIA\_UID.1/PACE, FIA\_UAU.1/PACE) being, in turn, supported by FCS\_CKM.1/DH\_PACE. Since PACE can use eID-PIN as the shared secret, using and management of eID-PIN (FIA\_AFL.1/eID-PIN\_Suspending, FIA\_AFL.1/eID-PIN\_Blocking, FMT\_MTD.1/eID-PIN\_Resume, FMT\_MTD.1/eID-PIN\_Unblock, FMT\_MTD.1/eID-PIN\_Activate) also support achievement of this objective. FDP\_RIP.1 requires erasing the temporal values of eID-PIN, eID-PUK.

FIA\_UAU.4, FIA\_UAU.5 and FCS\_CKM.4 represent some required specific properties of the protocols used.

To allow a verification of the certificate chain as required in FMT\_MTD.3, the CVCA's public key and certificate as well as the current date are written or update by authorised identified role as required by FMT\_MTD.1/CVCA\_INI, FMT\_MTD.1/CVCA\_UPD and FMT\_MTD.1/DATE.

Unauthorised modifying of the exchanged data is addressed, in the first line, by FTP\_ITC.1/CA using FCS\_COP.1/CMAC. A prerequisite for establishing this trusted channel is a successful Chip Authentication FIA\_API.1/CA using FCS\_CKM.1/DH\_CA and FCS\_CKM.2/DH and possessing the special properties FIA\_UAU.5, FIA\_UAU.6. The CA provides an evidence of possessing the Chip Authentication Private Key (SK<sub>PICC</sub>). FMT\_MTD.1/SK\_PICC governs creating/loading SK<sub>PICC</sub>, FMT\_MTD.1/KEY\_READ requires to make this key unreadable for a user, so that its value remains confidential. FDP\_RIP.1 requires erasing the values of SK<sub>PICC</sub> and session keys (here: for K<sub>MAC</sub>).

FMT\_MTD.1/PA\_UPD requires that SO<sub>C</sub> containing, amongst other, signature over the PK<sub>PICC</sub> and used for the Passive Authentication is allowed to be modified by the Personalisation Agent only and, hence, is to consider as trustworthily.

The SFRs FCS\_COP.1/SHA and FCS\_RND.1 represent the general support for cryptographic operations needed.

The SFRs FMT\_SMF.1 and FMT\_SMR.1 support the functions and roles related.

- 294 The security objective **OT.Data\_Authenticity** aims ensuring authenticity of the User- and TSF-data (after the Terminal- and the Chip Authentication) by enabling its verification at the terminal-side and by an active verification by the TOE itself.

This objective is mainly achieved by FTP\_ITC.1/CA using FCS\_COP.1/CMAC. A prerequisite for establishing this trusted channel is a successful Chip Authentication FIA\_API.1/CA using FCS\_CKM.1/DH\_CA and FCS\_CKM.2/DH and possessing the special properties FIA\_UAU.5, FIA\_UAU.6. The CA provides an evidence of possessing the Chip Authentication Private Key (SK<sub>PICC</sub>). FMT\_MTD.1/SK\_PICC governs creating/loading SK<sub>PICC</sub>, FMT\_MTD.1/KEY\_READ requires to make this key unreadable for a user, so that its value remains confidential. FDP\_RIP.1 requires erasing the values of SK<sub>PICC</sub> and session keys (here: for K<sub>MAC</sub>).

FMT\_MTD.1/PA\_UPD requires that SO<sub>C</sub> containing, amongst other, signature over the PK<sub>PICC</sub> and used for the Passive Authentication is allowed to be modified by the Personalisation Agent only and, hence, is to consider as trustworthily.

A prerequisite for successful CA is an accomplished TA as required by

FIA\_UID.1/Rightful\_Terminal, FIA\_UAU.1/Rightful\_Terminal (is supported by FCS\_COP.1/SIG\_VER). The TA protocol uses the result of the PACE authentication (FIA\_UID.1/PACE, FIA\_UAU.1/PACE) being, in turn, supported by FCS\_CKM.1/DH\_PACE. Since PACE can use eID-PIN as the shared secret, using and management of eID-PIN (FIA\_AFL.1/eID-PIN\_Suspending, FIA\_AFL.1/eID-PIN\_Blocking, FMT\_MTD.1/eID-PIN\_Resume, FMT\_MTD.1/eID-PIN\_Unblock, FMT\_MTD.1/eID-PIN\_Activate) also support achievement of this objective. FDP\_RIP.1 requires erasing the temporal values of eID-PIN, eID-PUK.

FIA\_UAU.4, FIA\_UAU.5 and FCS\_CKM.4 represent some required specific properties of the protocols used.

To allow a verification of the certificate chain as required in FMT\_MTD.3, the CVCA's public key and certificate as well as the current date are written or update by authorised identified role as required by FMT\_MTD.1/CVCA\_INI, FMT\_MTD.1/CVCA\_UPD and FMT\_MTD.1/DATE.

The SFRs FCS\_COP.1/SHA and FCS\_RND.1 represent the general support for cryptographic operations needed.

The SFRs FMT\_SMF.1 and FMT\_SMR.1 support the functions and roles related.

- 295 The security objective **OT.Data\_Confidentiality** aims that the TOE always ensures confidentiality of the User- and TSF-data stored and, after the Terminal- and the Chip Authentication, of these data exchanged.

This objective for the data stored is mainly achieved by FDP\_ACC.1/TRM and FDP\_ACF.1/TRM. A concrete authorisation level is achieved by the terminal identification/authentication as required by the SFRs FIA\_UID.1/Rightful\_Terminal, FIA\_UAU.1/Rightful\_Terminal (is supported by FCS\_COP.1/SIG\_VER). The TA protocol uses the result of the PACE authentication (FIA\_UID.1/PACE, FIA\_UAU.1/PACE) being, in turn, supported by FCS\_CKM.1/DH\_PACE. Since PACE can use eID-PIN as the shared secret, using and management of eID-PIN (FIA\_AFL.1/eID-PIN\_Suspending, FIA\_AFL.1/eID-PIN\_Blocking, FMT\_MTD.1/eID-PIN\_Resume, FMT\_MTD.1/eID-PIN\_Unblock, FMT\_MTD.1/eID-PIN\_Activate) also support achievement of this objective. FDP\_RIP.1 requires erasing the temporal values of eID-PIN, eID-PUK.

FIA\_UAU.4, FIA\_UAU.5 and FCS\_CKM.4 represent some required specific properties of the protocols used.

To allow a verification of the certificate chain as required in FMT\_MTD.3, the CVCA's public key and certificate as well as the current date are written or update by authorised identified role as required by FMT\_MTD.1/CVCA\_INI, FMT\_MTD.1/CVCA\_UPD and FMT\_MTD.1/DATE.

This objective for the data exchanged is mainly achieved by FTP\_ITC.1/CA using FCS\_COP.1/AES. A prerequisite for establishing this trusted channel is a successful Chip Authentication FIA\_API.1/CA using FCS\_CKM.1/DH\_CA and FCS\_CKM.2/DH and possessing the special properties FIA\_UAU.5, FIA\_UAU.6. The CA provides an evidence of possessing the Chip Authentication Private Key (SK\_PICC). FMT\_MTD.1/SK\_PICC governs creating/loading SK\_PICC, FMT\_MTD.1/KEY\_READ requires to make this key unreadable for a user, so that its value remains confidential. FDP\_RIP.1 requires erasing the values of SK\_PICC and session keys (here: for K<sub>Enc</sub>).

FMT\_MTD.1/PA\_UPD requires that SO<sub>C</sub> containing, amongst other, signature over the PK\_PICC and used for the Passive Authentication is allowed to be modified by the Personalisation Agent only and, hence, is to consider as trustworthily.

The SFRs FCS\_COP.1/SHA and FCS\_RND.1 represent the general support for cryptographic operations needed.

The SFRs FMT\_SMF.1 and FMT\_SMR.1 support the functions and roles related.

- 296 The security objective **OT.Tracing** aims that the TOE prevents gathering TOE tracing data by means of unambiguous identifying the RP\_Card remotely through establishing or listening to a communication via the contactless interface of the TOE without a priori knowledge of the correct

values of shared passwords (CAN, MRZ, eID-PIN, eID-PUK).

This objective is achieved as follows:

- (i) while establishing PACE communication with CAN, MRZ or eID-PUK (non-blocking authentication / authorisation data) – by FIA\_AFL.1/PACE;
- (ii) while establishing PACE communication using eID-PIN (blocking authentication data) – by FIA\_AFL.1/eID-PIN\_Blocking;
- (iii) for listening to PACE communication and for establishing CA communication (is of importance for the current PP, if SO<sub>C</sub> and PK<sub>PICC</sub> are card-individual) – FTP\_ITC.1/PACE;
- (iv) for listening to CA communication (readable and writable user data: document details data, biographic data, biometric reference data; eSign-PIN) – FTP\_ITC.1/CA.

- 297 The security objective **OT.Chip\_Auth\_Proof** aims enabling verification of the authenticity of the TOE as a whole device.

This objective is mainly achieved by FIA\_API.1/CA using FCS\_CKM.1/DH\_CA. The CA provides an evidence of possessing the Chip Authentication Private Key (SK<sub>PICC</sub>). FMT\_MTD.1/SK\_PICC governs creating/loading SK<sub>PICC</sub>, FMT\_MTD.1/KEY\_READ requires to make this key unreadable for a user, so that its value remains confidential. FDP\_RIP.1 requires erasing the values of SK<sub>PICC</sub> and session keys (here: for CMAC).

The authentication token T<sub>PICC</sub> is calculated using FCS\_COP.1/CMAC. The SFRs FCS\_COP.1/SHA and FCS\_RND.1 represent the general support for cryptographic operations needed.

FMT\_MTD.1/PA\_UPD requires that SO<sub>C</sub> containing, amongst other, signature over the PK<sub>PICC</sub> and used for the Passive Authentication is allowed to be modified by the Personalisation Agent only and, hence, is to consider as trustworthily.

- 298 The security objective **OT.Prot\_Abuse\_Func** aims preventing TOE's functions being not intended to be used in the operational phase from manipulating and disclosing the User- and TSF-data.

This objective is achieved by FMT\_LIM.1 and FMT\_LIM.2 preventing misuse of test and other functionality of the TOE having not to be used in the TOE's operational life cycle phase.

- 299 The security objective **OT.Prot\_Inf\_Leak** aims protection against disclosure of confidential User- or/and TSF-data stored on / processed by the TOE.

This objective is achieved

- by FPT\_EMSEC.1 for measurement and analysis of the shape and amplitude of signals or the time between events found by measuring signals on the electromagnetic field, power consumption, clock, or I/O lines,
- by FPT\_FLS.1 and FPT\_TST.1 for forcing a malfunction of the TOE, and
- by FPT\_PHP.3 for a physical manipulation of the TOE.

- 300 The security objective **OT.Prot\_Phys-Tamper** aims protection of the confidentiality and integrity of the User- and TSF-data as well as embedded software stored in the TOE.

This objective is completely covered by FPT\_PHP.3 in an obvious way.

- 301 The security objective **OT.Prot\_Malfunction** aims ensuring a correct operation of the TOE by preventing its operation outside the normal operating conditions.

This objective is covered by FPT\_TST.1 requiring self tests to demonstrate the correct operation of the TOE and tests of authorised users to verify the integrity of the TSF-data and the embedded software (TSF code) as well as by FPT\_FLS.1 requiring entering a secure state of the TOE in case of detected failure or operating conditions possibly causing a malfunction.

- 302 The rationale related to the security objectives taken over from [6], [7] and [8]<sup>225</sup> are exactly the same as given for the respective items of the security policies definitions in sec. 6.3.1 of [6], sec. 6.3.1 of [7] and sec. 11.1 of [8], respectively.

### 6.3.2 Rationale for SFR's Dependencies

- 303 The dependency analysis for the security functional requirements shows that the basis for mutual support and internal consistency between all defined functional requirements is satisfied. All dependencies between the chosen functional components are analysed, and non-dissolved dependencies are appropriately explained.
- 304 The dependency analysis has directly been made within the description of each SFR in sec. 6.1 above. All dependencies being expected by CC part 2 and by extended components definition in chap. 5 are either fulfilled or their non-fulfilment is justified.
- 305 The rationale for SFR's dependencies related to the security functional requirements taken over from [6], [7] and [8] are exactly the same as given for the respective items of the security policy definitions in sec. 6.3.2 of [6], sec. 6.3.2 of [7] and sec. 11.2 of [8], respectively.

### 6.3.3 Security Assurance Requirements Rationale

- 306 The current assurance package was chosen based on the pre-defined assurance package EAL4. This package permits a developer to gain maximum assurance from positive security engineering based on good commercial development practices which, though rigorous, do not require substantial specialist knowledge, skills, and other resources. EAL4 is the highest level, at which it is likely to retrofit to an existing product line in an economically feasible way. EAL4 is applicable in those circumstances where developers or users require a moderate to high level of independently assured security in conventional commodity TOEs and are prepared to incur additional security specific engineering costs.
- 307 The selection of the component ALC\_DVS.2 provides a higher assurance of the security of the RP\_Card's development and manufacturing, especially for the secure handling of sensitive material.
- 308 The selection of the component ATE\_DPT.2 provides a higher assurance than the pre-defined EAL4 package due to requiring the functional testing of SFR-enforcing modules.
- 309 The selection of the component AVA\_VAN.5 provides a higher assurance than the pre-defined EAL4 package, namely requiring a vulnerability analysis to assess the resistance to penetration attacks performed by an attacker possessing a high attack potential (see also Table 4, entry 'Attacker'). This decision represents a part of the conscious security policy for the RP\_Card required by the RP\_Card Issuer and reflected by the current PP.
- 310 The set of *assurance* requirements being part of EAL4 fulfils all dependencies a priori.

---

<sup>225</sup> incl. OT.SCD/SVD\_Gen, OT.Sigy\_SigF and FIA\_UAU.1/SSCD. The component FIA\_UAU.1/SSCD is re-defined in the current PP in such a way that, additionally to [8], establishing a trusted channel (FTP\_ITC.1/CA) between CGA resp. HID and the TOE is allowed before user authentication. Establishing this trusted channel does not represent any weakening FIA\_UAU.1/SSCD compared with the respective SFR in [8].

311 The augmentation of EAL4 chosen comprises the following assurance components:

- ALC\_DVS.2,
- ATE\_DPT.2 and
- AVA\_VAN.5.

312 For these additional assurance component, all dependencies are met or exceeded in the EAL4 assurance package:

Component	Dependencies required by CC Part 3 or ASE_ECD	Dependency fulfilled by
<b>TOE security assurance requirements (only additional to EAL4)</b>		
ALC_DVS.2	no dependencies	-
ATE_DPT.2	ADV_ARC.1	ADV_ARC.1
	ADV_TDS.3	ADV_TDS.3
	ATE_FUN.1	ATE_FUN.1
AVA_VAN.5	ADV_ARC.1	ADV_ARC.1
	ADV_FSP.4	ADV_FSP.4
	ADV_TDS.3	ADV_TDS.3
	ADV_IMP.1	ADV_IMP.1
	AGD_OPE.1	AGD_OPE.1
	AGD_PRE.1	AGD_PRE.1
	ATE_DPT.1	ATE_DPT.2

**Table 25: SAR Dependencies**

#### 6.3.4 Security Requirements – Internal Consistency

313 The following part of the security requirements rationale shows that the set of security requirements for the TOE consisting of the security functional requirements (SFRs) and the security assurance requirements (SARs) together forms an internally consistent whole.

314 The analysis of the TOE's security requirements with regard to their mutual supportiveness and internal consistency demonstrates:

The dependency analysis in section 6.3.2 'Rationale for SFR's Dependencies' for the security functional requirements shows that the basis for internal consistency between all defined functional requirements is satisfied. All dependencies between the chosen functional components are analysed and non-satisfied dependencies are appropriately explained.

All subjects and objects addressed by more than one SFR in sec. 6.1 are also treated in a consistent way: the SFRs impacting them do not require any contradictory property and behaviour of these 'shared' items.

The assurance package EAL4 is a pre-defined set of internally consistent assurance requirements. The dependency analysis for the sensitive assurance components in section 6.3.3

‘Security Assurance Requirements Rationale’ shows that the assurance requirements are internally consistent as all (additional) dependencies are satisfied and no inconsistency appears.

- 315 Inconsistency between functional and assurance requirements could only arise, if there are functional-assurance dependencies being not met: an opportunity shown not to arise in sections 6.3.2 ‘Rationale for SFR’s Dependencies’ and 6.3.3 ‘Security Assurance Requirements Rationale’. Furthermore, as also discussed in section 6.3.3 ‘Security Assurance Requirements Rationale’, the chosen assurance components are adequate for the functionality of the TOE. So, there are no inconsistencies between the goals of these two groups of security requirements.

## 7 Glossary and Acronyms

### Glossary

Term	Definition
<i>Accurate Terminal Certificate</i>	A Terminal Certificate is accurate, if the issuing Document Verifier is trusted by the RP_Card's chip to produce Terminal Certificates with the correct certificate effective date, see [12], sec. 2.2.5.
<i>Advanced Electronic Signature</i>	Electronic signature according to [15] which meets the following requirements: <ul style="list-style-type: none"> <li>- uniquely linked to the signatory;</li> <li>- capable of identifying the signatory;</li> <li>- created using means that the signatory can maintain under his sole control and</li> <li>- linked to the data to which it relates in such a manner that any subsequent change of the data is detectable.</li> </ul>
<i>Advanced Inspection Procedure (with PACE)</i>	A specific order of authentication steps between <i>ePassport</i> and a terminal as required by [12], sec. G.3, namely (i) PACE, (ii) Chip Authentication (version 1), (iii) Passive Authentication with SO <sub>D</sub> and (iv). Terminal Authentication (version 1). AIP can generally be used by EIS-AIP-PACE and EIS-AIP-BAC.
<i>Agreement</i>	This term is used in the current PP in order to reflect an appropriate relationship between the parties involved, but not as a legal notion.
<i>Application note</i>	Optional informative part of the PP containing sensitive supporting information that is considered relevant or useful for the construction, evaluation or use of the TOE.
<i>Audit records</i>	Write-only-once non-volatile memory area of the RP_Card's chip to store the Initialisation Data and Pre-personalisation Data.
<i>Authentication terminal (ATT)</i>	<p>A technical system being operated and used either by a governmental organisation (Official Domestic Document Verifier) or by any other, also commercial organisation and (i) verifying the RP_Card presenter as the RP_Card holder (using secret eID-PIN), (ii) updating a subset of the data of the eID application and (iii) activating the eSign application.</p> <p>An Authentication Terminal is a PCT additionally supporting the Chip Authentication (incl. passive authentication) and the Terminal Authentication protocols in the context of GAP and is authorised by the RP_Card Issuer through the Document Verifier of receiving branch (by issuing terminal certificates) to access a subset of the data stored on the RP_Card.</p> <p>See also par. 23 above and [12], chap. 3.2 and C.4.</p> <p>For the <i>eSign</i> application, it is equivalent to CGA as defined in [8].</p>
<i>Authenticity</i>	Ability to confirm that the RP_Card itself and the data elements stored in were issued by the RP_Card Issuer
<i>Basic Access Control (BAC)</i>	Security mechanism defined in [9] by which means the MRTD's chip proves and an inspection system (with BAC) protects their communication by means of secure messaging with Document Basic Access Keys (see there) based on MRZ information as key seed and access condition to data

Term	Definition
	stored on MRTD's chip according to LDS.
<i>Basic Inspection System with Basic Access Control protocol (BIS-BAC)</i>	<p>A technical system being used by an official organisation<sup>226</sup> and operated by a governmental organisation (i.e. an Official Domestic or Foreign Document Verifier) and verifying correspondence between the stored and printed MRZ.</p> <p>BIS-BAC implements the terminal's part of the Basic Access Control protocol and authenticates itself to the RP_Card using the Document Basic Access Keys drawn from printed MRZ data for reading the less-sensitive data (RP_Card document details data and biographical data) stored on the RP_Card (<i>ePassport</i> application only).</p> <p>See also <i>Application note 4</i>, [12], chap. G.1 and H; also [9].</p>
<i>Basic Inspection System with PACE protocol (BIS-PACE)</i>	<p>A technical system being used by an inspecting authority and operated by a governmental organisation (i.e. an Official Domestic or Foreign Document Verifier) and verifying the RP_Card presenter as the RP_Card holder (for <i>ePassport</i>: by comparing the real biometrical data (face) of the <i>ePass</i> presenter with the stored biometrical data (DG2) of the RP_Card holder).</p> <p>BIS-PACE is a PCT additionally supporting/applying the Passive Authentication protocol and is authorised by the RP_Card Issuer through the Document Verifier of receiving state to read a subset of data stored in the <i>ePassport</i> application on the RP_Card.</p> <p>BIS-PACE in the context of [12] (and of the current PP) is similar, but not equivalent to the Basic Inspection System (BIS) as defined in [5].</p> <p>See also [12], sec. 3.2.1, G.1 and G.2.</p>
<i>Biographical data (biodata)</i>	The personalised details of the RP_Card holder appearing as text in the visual and machine readable zones of and electronically stored in the RP_Card. The biographical data are less-sensitive data.
<i>Biometric reference data</i>	Data stored for biometric authentication of the RP_Card holder in the RP_Card as (i) digital portrait and (ii) optional biometric reference data.
<i>Card Access Number (CAN)</i>	A short password that is printed or displayed on the document. The CAN is a non-blocking password. The CAN may be static (printed on the Residence Permit Card), semi-static (e.g. printed on a label on the Residence Permit Card) or dynamic (randomly chosen by the electronic RP_Card and displayed by it using e.g. ePaper, OLED or similar technologies), see [12], sec. 3.3
<i>Card Security Object (SO<sub>C</sub>)</i>	<p>An RFC 3852 CMS Signed Data Structure signed by the Document Signer (DS). It is stored in the RP_Card (EF.CardSecurity, see [12], table A.1 and sec. A.1.2) and carries the hash values of different Data Groups as defined in [12], Appendix A. It shall also carry the Document Signer Certificate (C<sub>DS</sub>), [12], A.1.2.</p> <p>Please note that [12] uses the same notation SO<sub>C</sub> for Card and Chip Security Objects. Card and Chip Security Objects may differ with respect to the contained Chip Authentication Public Key (PK<sub>PICC</sub>): If, for privacy reasons, multiple RP_Cards share the same Chip Authentication Public Keys (i.e. generation keys), the Card Security Object shall contain generation PK<sub>PICC</sub></p>

<sup>226</sup> an inspecting authority; concretely, by a control officer

Term	Definition
	and Chip Security Object – chip-individual $PK_{PICC}$ , cf. [12], sec. A.1.2.
<i>Certificate chain</i>	Hierarchical sequence of Terminal Certificate (lowest level), Document Verifier Certificate and Country Verifying Certification Authority Certificates (highest level), where the certificate of a lower lever is signed with the private key corresponding to the public key in the certificate of the next higher level. The Country Verifying Certification Authority Certificate is signed with the private key corresponding to the public key it contains (self-signed certificate).
<i>Certification Service Provider (CSP)</i>	An organisation issuing certificates and providing other services related to electronic signatures. There can be ‘common’ and ‘qualified’ CSP: A ‘qualified’ Certification Service Provider can also issue qualified certificates. A CSP is the Certification Service Provider in the sense of [8].
<i>Chip Security Object (SO<sub>C</sub>)</i>	An RFC 3852 CMS Signed Data Structure signed by the Document Signer (DS). It is stored in the RP_Card (EF.ChipSecurity, see [12], table A.1 and sec. A.1.2) and carries the hash values of different Data Groups as defined in [12], Appendix A. It shall also carry the Document Signer Certificate ( $C_{DS}$ ), [12], A.1.2.  Please note that [12] uses the same notation $SO_C$ for Card and Chip Security Objects. Card and Chip Security Objects may differ with respect to the contained Chip Authentication Public Key ( $PK_{PICC}$ ): If, for privacy reasons, multiple RP_Cards share the same Chip Authentication Public Keys (i.e. generation keys), the Card Security Object shall contain generation $PK_{PICC}$ and Chip Security Object – chip-individual $PK_{PICC}$ , cf. [12], sec. A.1.2.
<i>Counterfeit</i>	An unauthorised copy or reproduction of a genuine security document made by whatever means. [9]
<i>Country Signing CertA Certificate (C<sub>CSCA</sub>)</i>	Certificate of the Country Signing Certification Authority Public Key ( $K_{PuCSCA}$ ) issued by Country Signing Certification Authority and stored in the rightful terminals.
<i>Country Signing Certification Authority (CSCA)</i>	An organisation enforcing the policy of the RP_Card Issuer with respect to confirming correctness of user and TSF data stored in the RP_Card. The CSCA represents the country specific root of the PKI for the RP_Cards and creates the Document Signer Certificates within this PKI. The CSCA also issues the self-signed CSCA Certificate ( $C_{CSCA}$ ) having to be distributed by strictly secure diplomatic means, see. [9], 5.1.1. The Country Signing Certification Authority issuing certificates for Document Signers (cf. [9]) and the domestic CVCA may be integrated into a single entity, e.g. a Country CertA. However, even in this case, separate key pairs must be used for different roles, see [12], sec. 2.2.1.
<i>Country Verifying Certification Authority (CVCA)</i>	An organisation enforcing the privacy policy of the RP_Card Issuer with respect to protection of user data stored in the RP_Card (at a trial of a terminal to get an access to these data). The CVCA represents the country specific root of the PKI for the rightful terminals (EIS-AIP-BAC, EIS-GAP, ATT, SGT) and creates the Document Verifier Certificates within this PKI. Updates of the public key of the CVCA are distributed in form of CVCA Link-Certificates, see [12], chap. 2.2.1. The Country Signing Certification Authority (CSCA) issuing certificates for

Term	Definition
	Document Signers (cf. [9]) and the domestic CVCA may be integrated into a single entity, e.g. a Country CertA. However, even in this case, separate key pairs must be used for different roles, see [12], sec. 2.2.1.
<i>Current date</i>	The most recent certificate effective date contained in a valid CVCA Link Certificate, a DV Certificate or an Accurate Terminal Certificate known to the TOE, see [12], sec. 2.2.5.
<i>CV Certificate</i>	Card Verifiable Certificate according to [12], appendix C.
<i>CVCA link Certificate</i>	Certificate of the new public key of the Country Verifying Certification Authority signed with the old public key of the Country Verifying Certification Authority where the certificate effective date for the new key is before the certificate expiration date of the certificate for the old key.
<i>Digital Signature</i>	Data appended to, or a cryptographic transformation of, a data unit that allows a recipient of the data unit to prove the source and integrity of the data unit and protect against forgery, e.g. by the recipient; see [23].
<i>Document Basic Access Keys</i>	Pair of symmetric (two-key) Triple-DES keys used for secure messaging with encryption (key $KB_{ENC}$ ) and message authentication (key $KB_{MAC}$ ) of data transmitted between the TOE and an inspection system using BAC [9]. They are derived from the MRZ and used within BAC to authenticate an entity able to read the printed MRZ of the passport book; see [12], H.1.
<i>Document Details Data</i>	Data printed on and electronically stored in the RP_Card representing the document details like document type, issuing state, document number, date of issue, date of expiry, issuing authority. The document details data are less-sensitive data.
<i>Document Security Object (SO<sub>D</sub>)</i>	A RFC 3369 CMS Signed Data Structure, signed by the Document Signer (DS). Carries the hash values of the LDS Data Groups: A hash for each Data Group in use shall be stored in the Security Data. It is stored in the ePassport application (EF.SOD) of the RP_Card. It may carry the Document Signer Certificate (C <sub>DS</sub> ); see [9].
<i>Document Signer (DS)</i>	An organisation enforcing the policy of the CSCA and signing the Card/Chip and Document Security Objects stored on the RP_Card for passive authentication.  A Document Signer is authorised by the national CSCA issuing the Document Signer Certificate (C <sub>DS</sub> ), see [12], chap. 1.1 and [9].  This role is usually delegated to a Personalisation Agent.
<i>Document Verifier (DV)</i>	An organisation enforcing the policies of the CVCA and of a Service Provider (governmental or commercial organisation) and managing terminals belonging together (e.g. terminals operated by a State's border police), by – inter alia – issuing Terminal Certificates. A Document Verifier is therefore a CertA, authorised by at least the national CVCA to issue certificates for national terminals, see [12], chap. 2.2.2.  There can be Domestic and Foreign DV: A domestic DV is acting under the policy of the domestic CVCA being run by the RP_Card Issuer; a foreign DV is acting under a policy of the respective foreign CVCA (in this case

<sup>227</sup> the form of such an agreement may be of formal and informal nature; the term 'agreement' is used in the current PP in order to reflect an appropriate relationship between the parties involved.

<sup>228</sup> Existing of such an agreement may be technically reflected by means of issuing a C<sub>CVCA-F</sub> for the Public Key of the foreign CVCA signed by the domestic CVCA.

Term	Definition
	there shall be an appropriate agreement between the RP_Card Issuer und a foreign CVCA ensuring enforcing the RP_Card Issuer's privacy policy). 227,228
<i>Eavesdropper</i>	A threat agent reading the communication between the RP_Card and the Service Provider to gain the data on the RP_Card.
<i>eID application</i>	A part of the TOE containing the non-executable, related user data and the data needed for authentication; this application is intended to be used for accessing official and commercial services, which require access to the user data stored in the context of this application; see [12], sec. 3.1.2.
<i>Electronic Signature</i>	Data in electronic form that is attached to or logically associated with other electronic data and that serves as a method of authentication; see [15].
<i>Enrolment</i>	The process of collecting biometric samples from a person and the subsequent preparation and storage of biometric reference templates representing that person's identity; see [9].
<i>ePassport application</i>	A part of the TOE containing the non-executable, related user data (incl. biometric) as well as the data needed for authentication (incl. MRZ); this application is intended to be used by authorities, amongst other as a machine readable travel document (MRTD). See [12], sec. 3.1.1.
<i>eSign application</i>	A part of the TOE containing the non-executable data needed for generating qualified electronic signatures on behalf of the RP_Card holder as well as for authentication; this application is intended to be used in the context of official and commercial services, where a qualified electronic signature of the RP_Card holder is required. The eSign application is optional: it means that it can optionally be activated <sup>229</sup> on the RP_Card by a Certification Service Provider (or on his behalf) using the ATT with an appropriate effective authorisation level. See [12], sec. 3.1.3.
<i>Extended Access Control</i>	Security mechanism identified in [9] by which means the MRTD's chip (i) verifies the authentication of the inspection systems authorised to read the optional biometric reference data, (ii) controls the access to the optional biometric reference data and (iii) protects the confidentiality and integrity of the optional biometric reference data during their transmission to the inspection system by secure messaging.
<i>Extended Inspection System using AIP with BAC (EIS-AIP-BAC)</i>	A technical system being used by an inspecting authority and operated by a governmental organisation (i.e. an Official Domestic or Foreign Document Verifier) and verifying the RP_Card presenter as the RP_Card holder (for <i>ePassport</i> : by comparing the real biometrical data (face, fingerprint or iris) of the RP_Card presenter with the stored biometrical data (DG2 – DG4) of the RP_Card holder).  EIS-AIP-BAC is a Basic Inspection System (BIS) in the sense of [5] additionally supporting/applying Chip Authentication (incl. passive authentication) and Terminal Authentication protocols in the context of AIP and is authorised by the RP_Card Issuer through the Document Verifier of receiving state to read a subset of data stored on the RP_Card.  EIS-AIP-BAC in the context of [12] (and of the current PP) is equivalent to

<sup>229</sup> 'activated' means (i) generate and store in the *eSign* application one or more signature key pairs and (ii) optionally store there the related certificates

Term	Definition
	the Extended Inspection System (EIS) as defined in [6].
<i>Extended Inspection System using AIP with PACE (EIS-AIP-PACE)</i>	<p>A technical system being used by an inspecting authority and operated by a governmental organisation (i.e. an Official Domestic or Foreign Document Verifier) and verifying the RP_Card presenter as the RP_Card holder (for <i>ePassport</i>: by comparing the real biometrical data (face, fingerprint or iris) of the RP_Card presenter with the stored biometrical data (DG2 – DG4) of the RP_Card holder).</p> <p>EIS-AIP-PACE is a PCT additionally supporting/applying Chip Authentication (incl. passive authentication) and Terminal Authentication protocols in the context of AIP and is authorised by the RP_Card Issuer through the Document Verifier of receiving state to read a subset of data stored on the RP_Card.</p> <p>EIS-AIP-PACE in the context of [12] is similar, but not equivalent to the Extended Inspection System (EIS) as defined in [6].</p>
<i>Extended Inspection System using GAP (EIS-GAP)</i>	<p>A technical system being used by an inspecting authority and operated by a governmental organisation (i.e. an Official Domestic or Foreign Document Verifier) and verifying the RP_Card presenter as the RP_Card holder (for <i>ePassport</i>: by comparing the real biometrical data (face, fingerprint or iris) of the RP_Card presenter with the stored biometrical data (DG2 – DG4) of the RP_Card holder).</p> <p>EIS-GAP is a PCT additionally supporting/applying Chip Authentication (incl. passive authentication) and Terminal Authentication protocols in the context of GAP and is authorised by the RP_Card Issuer through the Document Verifier of receiving state to read a subset of data stored on the RP_Card.</p> <p>EIS-GAP in the context of [12] (and of the current PP) is similar, but not equivalent to the Extended Inspection System (EIS) as defined in [6].</p> <p>The specification [12], sec. 3.2 differ between Basic and Extended Inspection Systems, whereby</p> <ul style="list-style-type: none"> <li>- the BIS can only perform Standard Inspection Procedure according to [12], sec. G.2 and</li> <li>- the EIS can perform <ul style="list-style-type: none"> <li>(i) Advanced Inspection Procedure according to [12], sec. G.3 or</li> <li>(ii) General Authentication Procedure according to [12], sec. 3.1.1.</li> </ul> </li> </ul> <p>All roles and authorisation levels as described in C.4 of [12] exclusively refer to EIS.</p>
<i>Forgery</i>	Fraudulent alteration of any part of the genuine document, e.g. changes to the biographical data or portrait; see [9].
<i>General Authentication Procedure</i>	A specific order of authentication steps between an RP_Card and a terminal as required by [12], sec. 3.4, namely (i) PACE, (ii) Terminal Authentication (version 2), (iii) Passive Authentication with SO <sub>C</sub> and (iv) Chip Authentication (version 2) (and an additional Passive Authentication with SO <sub>D</sub> , see [12], sec. 3.1.1). GAP is used by EIS-GAP, ATT and SGT.
<i>Global Interoperability</i>	The capability of inspection systems (either manual or automated) in different States throughout the world to exchange data, to process data received from systems in other States, and to utilise that data in inspection operations in their respective States. Global interoperability is a major

Term	Definition
	objective of the standardised specifications for placement of both eye-readable and machine readable data in all MRTDs; see [9].
<i>IC Dedicated Software</i>	Software developed and injected into the chip hardware by the IC manufacturer. Such software might support special functionality of the IC hardware and be used, amongst other, for implementing delivery procedures between different players. The usage of parts of the IC Dedicated Software might be restricted to certain life cycle phases.
<i>IC Embedded Software</i>	Software embedded in an IC and not being designed by the IC developer. The IC Embedded Software is designed in the design life cycle phase and embedded into the IC in the manufacturing life cycle phase of the TOE.
<i>Impostor</i>	A person who applies for and obtains a document by assuming a false name and identity, or a person who alters his or her physical appearance to represent himself or herself as another person for the purpose of using that person's document; see [9].
<i>Improperly documented person</i>	A person who travels, or attempts to travel with: (a) an expired travel document or an invalid visa; (b) a counterfeit, forged or altered travel document or visa; (c) someone else's travel document or visa; or (d) no travel document or visa, if required; see [9].
<i>Initialisation Data</i>	Any data defined by the RP_Card manufacturer and injected into the non-volatile memory by the Integrated Circuits manufacturer. These data are, for instance, used for traceability and for IC identification as RP_Card material (IC identification data).
<i>Inspection</i>	The act of an inspection authority examining an RP_Card presented to it by an RP_Card presenter and verifying its authenticity as the RP_Card holder. See also [9].
<i>Inspection system</i>	see EIS-GAP, EIS-AIP-BAC and BIS-PACE for this PP. see also EIS-AIP-PACE and BIS-BAC for general information
<i>Integrated circuit (IC)</i>	Electronic component(s) designed to perform processing and/or memory functions. The RP_Card's chip is an integrated circuit.
<i>Integrity</i>	Ability to confirm the RP_Card and its data elements stored upon have not been altered from that created by the RP_Card Issuer.
<i>Issuing Organisation</i>	Organisation authorised to issue an official travel document (e.g. the United Nations Organisation, issuer of the Laissez-passer); see [9].
<i>Issuing State</i>	The country issuing the MRTD; see [9].
<i>Logical Data Structure (LDS)</i>	The collection of groupings of Data Elements stored in the optional capacity expansion technology [9]. The capacity expansion technology used is the MRTD's chip.
<i>Machine readable travel document (MRTD)</i>	Official document issued by a state or organisation which is used by the holder for international travel (e.g. passport, visa, official document of identity) and which contains mandatory visual (eye readable) data and a separate mandatory data summary, intended for global use, reflecting essential data elements capable of being machine read; see [9].
<i>Machine readable zone (MRZ)</i>	Fixed dimensional area located on the front of the MRTD or MRP Data Page or, in the case of the TD1, the back of the MRTD, containing mandatory and optional data for machine reading using OCR methods; see [9]. The MRZ-Password is a restricted-revealable secret that is derived from the

Term	Definition
	machine readable zone and may be used for both PACE and BAC.
<i>Machine-verifiable biometrics feature</i>	A unique physical personal identification feature (e.g. an iris pattern, fingerprint or facial characteristics) stored on a travel document in a form that can be read and verified by machine; see [9].
<i>Malicious equipment</i>	A technical device being expected, but not possessing a valid, certified key pair for its authentication; validity of its certificate is not verifiable up to the respective root CertA (CVCA for a terminal and CSCA for an RP_Card).
<i>Manufacturer</i>	Generic term for the IC Manufacturer producing integrated circuit and the RP_Card Manufacturer completing the IC to the RP_Card. The Manufacturer is the default user of the TOE during the manufacturing life cycle phase. The TOE itself does not distinguish between the IC Manufacturer and RP_Card Manufacturer using this role Manufacturer.
<i>Metadata of a CV Certificate</i>	Data within the certificate body (excepting Public Key) as described in [12], sec. C.1.3. The metadata of a CV certificate comprise the following elements: <ul style="list-style-type: none"> <li>- Certificate Profile Identifier,</li> <li>- Certificate Authority Reference,</li> <li>- Certificate Holder Reference,</li> <li>- Certificate Holder Authorisation Template,</li> <li>- Certificate Effective Date,</li> <li>- Certificate Expiration Date,</li> <li>- Certificate Extensions (optional).</li> </ul>
<i>PACE Terminal (PCT)</i>	A technical system verifying correspondence between the password stored in the RP_Card and the related value presented to the terminal by the RP_Card presenter. PCT implements the terminal's part of the PACE protocol and authenticates itself to the RP_Card using a shared password (CAN, eID-PIN, eID-PUK or MRZ). See [12], chap. 3.3, 4.2, table 1.2 and G.2.
<i>Passive authentication</i>	Security mechanism implementing (i) verification of the digital signature of the Card/Chip or Document Security Object and (ii) comparing the hash values of the read data fields with the hash values contained in the Card/Chip or Document Security Object. See [12], sec. 1.1.
<i>Password Authenticated Connection Establishment (PACE)</i>	A communication establishment protocol defined in [12], sec. 4.2. The PACE Protocol is a password authenticated Diffie-Hellman key agreement protocol providing implicit password-based authentication of the communication partners (e.g. smart card and the terminal connected): i.e. PACE provides a verification, whether the communication partners share the same value of a password $\pi$ ). Based on this authentication, PACE also provides a secure communication, whereby confidentiality and authenticity of data transferred within this communication channel are maintained.
<i>Personal Identification Number (PIN)</i>	A short secret password being only known to the RP_Card holder. PIN is a blocking password, see [12], sec. 3.3.
<i>Personalisation</i>	The process by which the Personalisation Data are stored in and unambiguously, inseparably associated with the RP_Card.

Term	Definition
<i>Personalisation Agent</i>	An organisation acting on behalf of the RP_Card Issuer to personalise the RP_Card for the RP_Card holder by some or all of the following activities: (i) establishing the identity of the RP_Card holder for the biographic data in the RP_Card, (ii) enrolling the biometric reference data of the RP_Card holder, (iii) writing a subset of these data on the physical Residence Permit Card (optical personalisation) and storing them in the RP_Card (electronic personalisation) for the RP_Card holder as defined in [12], (iv) writing the document details data, (v) writing the initial TSF data, (vi) signing the Card/Chip Security Object and the Document Security Object (ePassport) defined in [9] (in the role of DS).  Please note that the role 'Personalisation Agent' may be distributed among several institutions according to the operational policy of the RP_Card Issuer. Generating signature key pair(s) is not in the scope of the tasks of this role.
<i>Personalisation Data</i>	A set of data incl. (i) individual-related data (biographic and biometric data, signature key pair(s) for the eSign application, if installed) of the RP_Card holder, (ii) dedicated document details data and (iii) dedicated initial TSF data (incl. the Card/Chip Security Object, if installed, and the Document Security Object). Personalisation data are gathered and then written into the non-volatile memory of the TOE by the Personalisation Agent in the life cycle phase <i>card issuing</i> .
<i>PIN Unblock Key (PUK)</i>	A long secret password being only known to the RP_Card holder. The PUK is a non-blocking password, see [12], sec. 3.3.
<i>Pre-personalisation Data</i>	Any data that is injected into the non-volatile memory of the TOE by the Manufacturer for traceability of the non-personalised RP_Card and/or to secure shipment within or between the life cycle phases <i>manufacturing</i> and <i>card issuing</i> .
<i>Pre-personalised RP_Card's chip</i>	RP_Card's chip equipped with a unique identifier and a unique asymmetric Authentication Key Pair of the chip.
<i>Qualified Electronic Signature</i>	Advanced electronic signature according to [15] that has been created with an SSCD by a key certified in a qualified certificate; see [15], Art. 5 (1) and [8].
<i>Receiving State</i>	The Country to which the RP_Card holder is applying for entry; see [9].
<i>Reference data</i>	Data enrolled for a known identity and used by the verifier to check the verification data provided by an entity to prove this identity in an authentication attempt.
<i>Remote terminal</i>	A remote device directly communicating with the TOE and using the technical infrastructure between them (Internet, a local RF-terminal) merely as a message carrier. Only after Chip Authentication when a secure end-to-end connection between the TOE and remote terminal is established, the TOE grants access to the data of the eID application, see [12], sec. 3.4.1.
<i>Residence Permit Card (physical and electronic)</i>	An optically and electronically readable document in form of a paper/plastic cover and an integrated smart card. The Residence Permit Card is used in order to verify that identity claimed by the Residence Permit Card presenter is commensurate with the identity of the Residence Permit Card holder stored on/in the card.

Term	Definition
<i>Restricted Identification</i>	Restricted Identification aims providing a temporary RP_Card identifier being specific for a terminal sector (pseudo-anonymisation) and supporting revocation features (sec. 2.3, 4.1, 4.5 of [12]). The security status of RP_Card is not affected by Restricted Identification.
<i>RF-terminal</i>	A device being able to establish communication with an RF-chip according to ISO/IEC 14443
<i>Rightful equipment (rightful terminal or rightful Card)</i>	A technical device being expected and possessing a valid, certified key pair for its authentication, whereby the validity of the related certificate is verifiable up to the respective root CertA. A rightful terminal can be either EIS-GAP, EIS-AIP-BAC and BIS-PACE (see <i>Inspection System</i> ) or ATT or SGT. A terminal as well as a Card can represent the rightful equipment, whereby the root CertA for a terminal is CVCA and for a Card – CSCA.
<i>RP_Card (electronic)</i>	The contactless smart card integrated into the plastic, optical readable cover and providing the following applications: ePassport, eID and eSign (optionally)
<i>RP_Card holder</i>	A person for whom the RP_Card Issuer has personalised the RP_Card.
<i>RP_Card Issuer (issuing authority)</i>	Organisation authorised to issue an electronic Residence Permit Card to the RP_Card holder
<i>RP_Card presenter</i>	A person presenting the RP_Card to a terminal and claiming the identity of the RP_Card holder.
<i>Secondary image</i>	A repeat image of the holder's portrait reproduced elsewhere in the document by whatever means; see [9].
<i>Secure messaging in combined mode</i>	Secure messaging using encryption and message authentication code according to ISO/IEC 7816-4
<i>Service Provider</i>	An official or commercial organisation providing services which can be used by the RP_Card holder. Service Provider uses rightful terminals managed by a DV.
<i>Signature terminal (SGT)</i>	A technical system used for generation of electronic signatures. A Signature Terminal is a PCT additionally supporting the Chip Authentication (incl. passive authentication) and the Terminal Authentication protocols in the context of GAP and is authorised by the RP_Card Issuer through the Document Verifier of receiving branch (by issuing terminal certificates) to access a subset of the data stored on the RP_Card. See also par. 23 above and [12], chap. 3.2 and C.4. It is equivalent – as a general term – to SCA and HID as defined in [8].
<i>Skimming</i>	Imitation of a rightful terminal to read the RP_Card or parts of it via the contactless communication channel of the TOE without knowledge of the printed MRZ, CAN, eID-PIN or eID-PUK data.
<i>Standard Inspection Procedure</i>	A specific order of authentication steps between an RP_Card (ePassport only) and a terminal as required by [12], sec. G.2, namely (i) PACE and (ii) Passive Authentication with SO <sub>D</sub> . SIP can generally be used by BIS-PACE and BIS-BAC.
<i>Terminal</i>	A terminal is any technical system communicating with the TOE through the contactless interface.

Term	Definition
	The role 'Terminal' is the default role for any terminal being recognised by the TOE as neither PCT nor BIS-PACE nor EIS-AIP-BAC nor EIS-GAP nor ATT nor SGT ('Terminal' is used by the RP_Card presenter).
<i>Terminal Authorisation Level</i>	Intersection of the Certificate Holder Authorisations defined by the Terminal Certificate, the Document Verifier Certificate and Country Verifying Certification Authority which shall be all valid for the Current Date. It can additionally be restricted at terminal by RP_Card holder using CHAT.
<i>TOE tracing data</i>	Technical information about the current and previous locations of the RP_Card gathered by inconspicuous (for the RP_Card holder) recognising the RP_Card
<i>Travel document</i>	A passport or other official document of identity issued by a state or organisation which may be used by the rightful holder for international travel; see [9].
<i>TSF data</i>	Data created by and for the TOE that might affect the operation of the TOE (CC part 1 [1]).
<i>Unpersonalised RP_Card</i>	RP_Card material prepared to produce a personalised RP_Card containing an initialised and pre-personalised RP_Card's chip.
<i>User Data</i>	<p>All data (being not authentication data) stored in the context of the applications of the RP_Card as defined in [12] and</p> <ul style="list-style-type: none"> <li>(i) being allowed to be <i>read out</i> or <i>written</i> solely by an authenticated terminal (in the sense of [12], sec. 3.2) respectively</li> <li>(ii) being allowed to be <i>used</i> solely by an authenticated terminal (in the sense of [12], sec. 3.2) (the private Restricted Identification key; since the Restricted Identification according to [12], sec. 4.5 represents just a functionality of the RP_Card, the key material needed for this functionality and stored in the TOE is considered here as 'user data') respectively</li> <li>(iii) being allowed to be <i>used</i> solely by the authenticated RP_Card holder (the private signature key within the eSign application; from this point of view, the private signature key of the RP_Card holder is also considered as 'user data').</li> </ul> <p>CC give the following generic definitions for user data: Data created by and for the user that does not affect the operation of the TSF (CC part 1 [1]). Information stored in TOE resources that can be operated upon by users in accordance with the SFRs and upon which the TSF places no special meaning (CC part 2 [2]).</p>
<i>Verification data</i>	Data provided by an entity in an authentication attempt to prove their identity to the verifier. The verifier checks whether the verification data match the reference data known for the claimed identity.

## Acronyms

Acronym	Term
<i>AIP</i>	Advanced Inspection Procedure, [12], sec. 3.1.1
<i>ATT</i>	Authentication Terminal as defined in [12], sec. 3.2
<i>BAC</i>	Basic Access Control
<i>BIS</i>	Basic Inspection System
<i>BIS-BAC</i>	Basic Inspection System with BAC (equivalent to Basic Inspection System as used in [5])
<i>BIS-PACE</i>	Basic Inspection System with PACE (see [12], sec. 3.1.1, 3.2.1)
<i>CA</i>	Chip Authentication
<i>CAN</i>	Card Access Number
<i>CC</i>	Common Criteria
<i>CertA</i>	Certification Authority (the author dispensed with the usual abbreviation 'CA' in order to avoid a collision with 'Chip Authentication')
<i>CGA</i>	Certificate generation application, please refer to [8]. In the current context, it is represented by ATT for the eSign application.
<i>CHAT</i>	Certificate Holder Authorization Template
<i>DTBS</i>	Data to be signed, please refer to [8]
<i>DTBS/R</i>	Data to be signed or its unique representation, please refer to [8]
<i>EAC</i>	Extended Access Control
<i>EIS-AIP-BAC</i>	Extended Inspection System with BAC (equivalent to EIS as used in [6])
<i>EIS-AIP-PACE</i>	Extended Inspection System with PACE (see [12], sec. 3.1.1, 3.2.1)
<i>EIS-GAP</i>	Extended Inspection System using GAP (see [12], sec. 3.1.1, 3.2.1)
<i>GAP</i>	General Authentication Procedure (see [12], sec. 3.4)
<i>HID</i>	Human Interface Device, please refer to [8]. It is equivalent to SGT in the current context.
<i>MRZ</i>	Machine readable zone
<i>n.a.</i>	Not applicable
<i>OSP</i>	Organisational security policy
<i>PACE</i>	Password Authenticated Connection Establishment
<i>PCD</i>	Proximity Coupling Device
<i>PCT</i>	PACE-authenticated terminal
<i>PICC</i>	Proximity Integrated Circuit Chip
<i>PIN</i>	Personal Identification Number
<i>PP</i>	Protection Profile
<i>PUK</i>	PIN Unblock Key
<i>RAD</i>	Reference Authentication Data, please refer to [8]
<i>RF</i>	Radio Frequency
<i>SAR</i>	Security assurance requirements
<i>SCA</i>	Signature creation application, please refer to [8]. It is equivalent to SGT in the current context.

<b>Acronym</b>	<b>Term</b>
<i>SCD</i>	Signature Creation Data, please refer to [8]; the term ‘private signature key within the eSign application’ is synonym within the current PP.
<i>SFR</i>	Security functional requirement
<i>SGT</i>	Signature Terminal as defined in [12], sec. 3.2
<i>SIP</i>	Standard Inspection Procedure, see [12], sec. 3.1.1
<i>SVD</i>	Signature Verification Data, please refer to [8]
<i>TA</i>	Terminal Authentication
<i>TOE</i>	Target of Evaluation
<i>TSF</i>	TOE security functionality
<i>TSP</i>	TOE Security Policy (defined by the current document)
<i>VAD</i>	Verification Authentication Data, please refer to [8]

## 8 Bibliography

### Common Criteria

- [1] Common Criteria for Information Technology Security Evaluation, Part 1: Introduction and General Model; CCMB-2009-07-001, Version 3.1, Revision 3, July 2009
- [2] Common Criteria for Information Technology Security Evaluation, Part 2: Security Functional Components; CCMB-2009-07-002, Version 3.1, Revision 3, July 2009
- [3] Common Criteria for Information Technology Security Evaluation, Part 3: Security Assurance Requirements; CCMB-2009-07-003, Version 3.1, Revision 3, July 2009
- [4] Common Methodology for Information Technology Security Evaluation, Evaluation Methodology; CCMB-2009-07-004, Version 3.1, Revision 3, July 2009

### Protection Profiles

- [5] Common Criteria Protection Profile Machine Readable Travel Document with „ICAO Application“, Basic Access Control, BSI-CC-PP-0055-2009, version 1.10, 25<sup>th</sup> March 2009
- [6] Common Criteria Protection Profile Machine Readable Travel Document with „ICAO Application“, Extended Access Control, BSI-CC-PP-0056-2009, version 1.10, 25<sup>th</sup> March 2009
- [7] Common Criteria Protection Profile Electronic Passport using Standard Inspection Procedure with PACE, BSI-CC-PP-0068-2010, version 0.92, 30<sup>th</sup> April 2010
- [8] Protection Profiles for Secure Signature Creation Device – Part 2: Device with key generation, EN 14169-1:2009, ver. 1.03, 2009-12, BSI-CC-PP-0059-2009

### ICAO

- [9] ICAO Doc 9303-1, Specifications for electronically enabled passports with biometric identification capabilities. In *Machine Readable Travel Documents – Part 1: Machine Readable Passport*, volume 2, ICAO, 6th edition, 2006
- [10] ICAO Doc 9303-3, Specifications for electronically enabled official travel documents with biometric identification capabilities. In *Machine Readable Travel Documents – Part 3: Machine Readable Official Travel Documents*, volume 2, ICAO, 3rd edition, 2008.

### Technical Guidelines and Directives

- [11] Technical Guideline TR-03110 Advanced Security Mechanisms for Machine Readable Travel Documents – Extended Access Control (EAC), TR-03110, version 1.11, 21.02.2008, Bundesamt für Sicherheit in der Informationstechnik (BSI)
- [12] Technical Guideline TR-03110 Advanced Security Mechanisms for Machine Readable Travel Documents – Extended Access Control (EAC), Password Authenticated Connection Establishment (PACE) and Restricted Identification (RI), TR-03110, version 2.03, 24.03.2010, Bundesamt für Sicherheit in der Informationstechnik (BSI)<sup>230</sup>
